FOREWORD

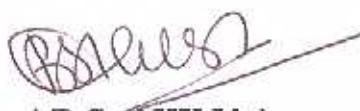

Water Resources planning requires time series data on hydrological aspects. The hydrological observation stations of CWC collect and process the basic hydrological data on gauge, discharge, silt, sedimentation and water quality on a regular basis for onward transmission to the CWC regional field offices, who document it in the form of Water Year Book, Sediment Year Book and Water Quality Year Book. Integrated Hydrological Data Book is a compendium of important hydrological information on major basins consolidated at the national level.

The present issue of the data book provides updated basin/site-wise data covering 12 non-classified basins covering aspects such as location, drainage area, population, temperature, average runoff, seasonal water flow, historical water levels, average sediment load, water quality parameters and land use statistics.

The compilation and presentation of data book has been done by the Hydrological Data Directorate of Information System Organisation in WP&P Wing of CWC, by collecting the required data from the field offices of CWC.

It is expected that the updated information would be of use to researchers, policy makers and the public at large. While every care has been taken to ensure accuracy of data, the possibility of errors and omissions in such a voluminous publication cannot altogether be ruled out.

Suggestion for improvement of the contents and presentation of the publication will be highly appreciated.

(B.S. AHUJA)

SECTION-I
DESCRIPTION OF DIFFERENT RIVER BASINS

DESCRIPTION OF DIFFERENT RIVER BASINS

1. Mahanadi Basin

Location: The basin is physically bounded in the North by Central India hills, in the South and East by the Eastern Ghats and in the West by Maikala hill range. The Chiroli Hills form the watershed dividing the Wainganga valley from the Mahanadi Basin, the upper portion of which is designed as the Chattisgarh Basin. It is a typical basin considered from geographical and geological point of view. The Mahanadi basin lies encompassed within geographical co-ordinates of $80^{\circ}30'$ to $86^{\circ}50'$ East longitudes and $19^{\circ}20'$ to $23^{\circ}35'$ of North latitudes running a total length of about 851 km.. The total catchment area of the basin is 1,41,600 sq.km..

The river Mahanadi is one of the major inter-state east flowing rivers in peninsular India. It originates at an elevation of about 442 m. above Mean Sea Level (m.s.l.) near Pharsiya village near Nagri town in Raipur district of Chhattisgarh. During the course of its traverse, it drains fairly large areas of Chhattisgarh and Orissa and comparatively small area in the state of Jharkhand and Maharashtra. The total length of the river from its origin to confluence of the Bay of Bengal is about 851 km., of which, 357 km. is in Chhattisgarh and the balance 494 km. in Orissa. During its traverse, a number of tributaries join the river on both the flanks. There are 14 major tributaries of which 12 nos. are joining upstream of Hirakud reservoir and 2 nos. down stream of it.

On the Left Bank six tributaries namely the Seonath, the Hasdeo, the Mand, the Ib, the Kelo and Borai drain into main channel upstream of Hirakud reservoir. The drainage system upstream of Hirakud reservoir is more extensive on the left bank of Mahanadi as compared to that on the Right Bank. On the Right Bank six tributaries namely the Pari, the Jonk, the Sukha, Kanji, the Lilar and the Lath join upstream of Hirakud reservoir and two tributaries namely Tel and Ong join down stream of it. The three major tributaries namely the Seonath and the Ib on the Left Bank and the Tel on the Right Bank together constitute nearly 46.63% of the total catchment area of the river Mahanadi. The Seonath, which is the largest tributary of Mahanadi, rises in village Kotgai, District Durg (Chhattisgarh) and drains three districts of Chhattisgarh namely Durg, Rajandgaon and Bilaspur. The Tel, which is the second largest tributary of Mahanadi River, rises in village Jorigam of Koraput district of Orissa and drains four districts of Orissa namely Koraput, Kalahandi, Balangir and Phulbhani. The Ib, which is the third largest tributary of Mahanadi, rises in village Pandrapat,

District Raigarh (Chhattisgarh) and drains Raigarh district of Chhattisgarh and two districts of Orissa, namely Sundergarh and Sambalpur.

Urban Centres: Three important urban centres in the basin are Raipur, Durg & Cuttack.

Industries: Mahanadi, because of its rich mineral reserve and adequate power resource has a favourable industrial climate. The important industries presently existing in the basin are iron & steel plant at Bhilai, aluminum factories at Hirakund and Korba, paper mill near Cuttack and cement industries at Sundargarh. Other industries based primarily on agricultural produce are sugar, textile and oil mills. Mining of coal, iron and manganese are other industrial activities.

Sites: The Central as well as State Governments carry out hydrological observations. The CWC maintains 21 gauge discharge sites in the basin. At 15 of these stations, sediment observations are also made.

2. Subernarekha, Burhabalang, & Baitarni

a) Subernarekha

Location: The Subernarekha is one of the longest east flowing inter-state river. It covers large areas of Bihar and some parts of West Bengal and Orissa. The basin lies between north latitudes of $21^{\circ}33'$ to $23^{\circ}32'$ and east longitudes of $85^{\circ}09'$ to $87^{\circ}27'$ situated in the northeast corner of the peninsular India. It is bounded on the northwest by the Chhotanagpur Plateau, in the south west by Brahmani Basin, in the south by Burhabalang basin and in the south-east by the Bay of Bengal.

The Subernarekha river originates near Nagri village in Ranchi district of Jharkhand at an elevation of 600 m. The total length of the river is about 395 Km. The principal tributaries of the river are Kanchi, Kharkai and Karkari.

Urban Centres: The important cities/ towns in the basin are Jamshedpur, Ranchi, Muri, etc.

Industries: Important industries in the basin are tobacco products in Chakradharpur, cement, asbestos sheets, glass and ceramics at Chaibasa. Locomotives and coaches, automobiles, agricultural equipment, wires and cables, iron and steel machinery, metal tubes and conduits, copper and brass, chemicals (acids) and caustics, fertilizers and Soaps at Jamshedpur.

The important minerals found in the basin are copper, uranium, chromium, gold, vanadium, limestone, dolomite, asbestos, china clay, talc and building stones besides iron and aluminum.

Sites: Water quality observation is also being done along with gauge and discharge observation at three sites Ghatsila, Muri and Adityapur. Sediment observations are made at only Ghatsila and Adityapur.

b) Burhabalang

Location: The Burhabalang is one of the cast flowing medium river situated in the northern part of Orissa State. It is bounded by the geographical co-ordinates of north latitudes between $21^{\circ}22'$ to $22^{\circ}20'$ and east longitudes $86^{\circ}20'$ to $87^{\circ}05'$. It drains parts of the areas in Mayurbhanj and Balasore districts of Orissa with a total catchment area of 4800 sq.km.. This is a flashy river having a source at an elevation of 800 m. and drops into the sea after traversing a total distance of 125 kms.

Urban Centres: The important town of the basin are Baripada and Balasore.

Industries: The basin has no large industry. Recently some medium and small scale industries have been established in and around Balasore and Baripada.

The basin has no significant mineral resources, iron ore, china clay, quartz and soap stone are found in limited areas in the Mayurbhanj portion of the basin. Limestone is seen in the Similipal hill ranges.

Sites: Gauge discharge observations are made at Govindpur station.

c) Baitarni

Location: The Baitarani is one of the important east flowing river of peninsular India, flowing eastward and joining the Bay of Bengal. The river rises in the hill ranges of Keonjhar District of Orissa near Mankaranco village at an elevation of about 900m. above m.s.l. On its way, many tributaries join the river from both banks. On its way many tributaries join the river from both banks. The total catchment area of this basin is 10,982 sq.km.. The basin is situated approximately between east longitudes of 85°-10' to 87°-03' and between north latitudes of 20°-35' to 22°-15'. The basin is surrounded by the Brahmani on the South and West, the Subernarekha on the north, the Burhabalang and the Bay of Bengal on the east. The river is flashy in nature having a total length of 355m, with the upper reach up to Anandpur in the hilly region. There is a considerable fall in geographical gradient from RL. 367m. at Champua to RL 28m at Anandpur.

Urban Centres: The important towns in the basin are Joda, Champua, Karanjia, Keonjhar, Anandpur and Jaipur.

Industries: The basin is backward from the industrial point of view. There are three medium scale industries in the basin viz. (i) Ferro-Manganese Plant (ii) The sponge Iron Plant at Joda and (iii) The Orissa Sponge Iron Plant. There are few small scale industries also in the basin.

The basin is rich in mineral wealth. Iron ore, copper, chromite, asbestos, manganese, atomic minerals, china clay and soap stone are available in Cuttack, Keonjhar, Mayurbhanj districts of Orissa and in the Singhbhum district of Bihar.

Sites: Water Quality observation is also being done along with gauge and discharge observations at sites Anandpur and Champua. Sediment observation is also made at these stations.

3. Brahmani

Location: The Brahmani is one of the major inter-state east flowing river amongst the peninsular rivers in India. This basin is situated within the geographical co-ordinates of north latitude $20^{\circ} - 28'$ to $23^{\circ} - 35'$ and east longitude $83^{\circ} - 52'$ to $87^{\circ} - 03'$ approximately. This basin is bounded in the north by Chhotanagpur plateau in the west and south by Mahanadi basin and in the east by the Bay of Bengal. The basin covers Bihar, Jharkhand, Madhya Pradesh and Orissa States and drains an area of 39033 sq.km..

The Brahmani, known as the South Koel in the upper reaches, originates near Nagri village in Ranchi District of Bihar at an elevation of about 600m. The total length of its run is about 799 km. The principal tributaries of this river are Sankh, Tirka and Karo.

Urban Centres: The important towns of the basin are, Rourkela, Talcher, Angul, Dhenkanal, Jajpur and Rajgangpur.

Industries: It has two prominent industrial belts, one at Rourkela and the other at Talcher. At Rourkela besides the Steel Plant there exist a number of other industries, like fertilizers, cement, explosives, chemicals and machine tools, The Talcher industrial area has the National Aluminium Company at Angul, the Fertilizer Plant and other small industries. The basin is rich in mineral resources like coal, iron ore, copper, bauxite, chromite, limestone, manganese, dolomites, lead, fire-clay and china clay, etc.

Sites: Water Quality observation is being conducted alongwith gauge and discharge observation at five G&D sites namely Jenapur, Gomlai, Panposh, Jaraikela and Tilga. Sediment observations are also made at all these five stations.

4. Rushikulya, Vamsadhara, Sarda & Nagavali

a) Rushikulya

Location: The river Rushikulya is one of the medium sized east flowing river in peninsular India. It is an important river of Orissa state and covers entire catchment area in the districts of Phulbani and Ganjam. The river flows through Purushottampur, Pratappur and joins with the Bay of Bengal at Ganjam district.

The river Rushikulya originates at an elevation of about 1000 m. near Matabarhi village of Phulbani district and lies within the geographical co-ordinates of $19^{\circ} 07'$ to $20^{\circ} 19'$ north latitude and $84^{\circ} 01'$ to $85^{\circ} 06'$ east longitude. The total catchment area is 7700 sq.km.

Urban Centres: Only one city Berhampur is situated in the basin and important towns are Chhatrapur, Ganjam, Aska, Bhajanagar and Sorada.

Industries: A number of large scale industries have been set up in the basin. Among them are M/s Jayashree Chemical Industries. Aska Co-operative Sugar Industries Ltd., Aska Spinning Mills, Monorama Chemical Works Ltd., Orissa Tubes Pvt. Ltd., etc. There are about 3360 numbers of small scale industries of different categories mainly food and allied, forest & wood based, rubber and plastic products and glass and ceramics. There is enough scope for setting up forest based industries. A major steel plant is proposed near Gopalpur. The basin is rich in mineral wealth. The major economic minerals are clay, lime stone, manganese, sand talc, black sand and grinding materials.

Sites: Gauge Discharge, sediment and water quality observation is made at Purushottampur station.

b) Vamsadhara

Location: The Vamsadhara river is an important east flowing river between Mahanadi and Godavari. The river originates near Lanjigarh village in Kalahanadi district and runs to a total distance of about 254 km. before it joins the Bay of Bengal at Kalingapatnam. A number of tributaries join the river on both the sides. Much of its catchment falls on the left. The basin is narrow and full of undulations. It is situated within the geographical co-ordinates of $18^{\circ} 15'$ to $19^{\circ} 55'$ north latitudes and $83^{\circ} 20'$ to $84^{\circ} 20'$ east longitudes. The total catchment area of this basin works out to 10830 Sq.km.

Urban Centres: Srikakulam, Narasannapeta, Patapatnam, tekkali, Palasa, Sompeta, Parlakhemundi, Gunupur, Kashinagar, Bissam Cuttack are the important towns in the basin.

Industries: There is no large scale industry in the basin but there are a number of agro and forest based small scale industries in Srikakulam district of Andhra Pradesh and Koraput & Kalahandi district of Orissa. The important minerals found in the Vamsdhara basin are manganese, graphite, quartz, limestone, mica and bauxite besides building materials. Manganese ore is available extensively in Srikakulam and Koraput districts.

Sites: Water quality, Gauge discharge and sediment observations are done at Kashinagar station. Gauge discharge observation is also made at Gunupur.

c) Sarada

Location: The river Sarada, an east flowing medium sized river, lies in the district of Visakhapatnam of Andhra Pradesh. The geographical co-ordinates of the river are north latitude $17^{\circ} 25'$ to $18^{\circ} 17'$ and east longitude $82^{\circ} 32'$ to $83^{\circ} 06'$. The basin is surrounded by Nagavali in the north, Gostari, Gambi Ramgedda, Megadnigedda in the east Bay of Bengal in the South and Machhkund sub-basin of the Godavari in the west. The catchment area of the basin is 2665 sq.km. It rises at an elevation of 1000 m. and runs a distance of 122 Kms. before joining the sea.

Urban Centres: Visakhapatnam is the main important town in the basin.

Industries: There are many large scale industries like Visakhapatnam Steel plant, Bharat Heavy Plates and Vessels Limited, Hindustan Shipyard Ltd. etc. Important minerals found in the basin are manganese, quartz, graphite, mica, bauxite, aluminium and fire clay.

Sites: Gauge & discharge observations are made at Anakapali station.

d) Nagavali

Location: The river Nagavali is a medium sized east flowing river in peninsular India and lies within the geographical co-ordinates of north latitude $18^{\circ} 10'$ to $19^{\circ} 44'$ and east longitudes of $82^{\circ} 53'$ and $84^{\circ} 05'$. It is surrounded by Vamsadhara in the north, Champavathi and Peddagedda in the south, Godavari in the west and the Bay of Bengal in the east. It drains parts of the districts of Kalahandi, Rayagada, Koraput of Orissa and Srikakulam, Vijayanagaram and Visakhapatnam of Andhra Pradesh state. The total basin area is 9510 sq.km.

The Nagavali originates near the Lakhbhal in Kalahandi district at an elevation of about 1300m. The total length of the river run is 256 Km. out of which the first 161 kms, are in Orissa and the rest in Andhra Pradesh. The important tributaries are Barha, Baldiya, Satklnala, Sitagurha, Srikona, Janjhvati, Gumi digedda, Vottigedda, Suvrarnamukhi, Vonigedda, Vagavathi and Relligedda.

Urban Centres: The important towns in the basin are Amadalavalasa, Rayagada, Parvatipuram, Palkonda, Veeragattam and Bobbili.

Industries: The basin has no large industry. The existing small scale industries are mostly oriented to forest and agricultural produce and are located in the Srikakulam Regional Economy. Manganese, quartz, mica, graphite, limestone, bauxite and construction materials are found in abundance in the Basin.

Sites: Gauge discharge, sediment and water quality observations are made at Srikakulum station.

5. Godavari

Location: The river Godavari, the largest of the peninsular rivers, and third largest in India, drains about 10% of India's total geographical area. The catchment area of the river is 3,12,812 sq.km. and is spread in the States of Maharashtra (48.6%), Andhra Pradesh (23.4%), Madhya Pradesh (10.0%), Chhattisgarh (10.9%), Orissa (5.7%) and Karnataka (1.4%) The basin lies in the Deccan Plateau and is situated between latitude 16° 16' North and 22° 43' North and longitude 73° 26' East and 83° 07' East.

The river Godavari rises in the Nasik district of Maharashtra, about 80 km. from the Arabian sea at an elevation of 1,067 m after flowing for about 1,465 km in a generally south-east direction, through Maharashtra and Andhra Pradesh it falls into the Bay of Bengal.

The Godavari basin is bounded on the north by the Satmala Hills, the Ajantha Range and the Mahadeo Hills on the south and east by the Eastern Ghats and on the west by the Western Ghats. The basin is roughly triangular in shape and the main river itself runs practically along the base of the triangle.

The western edge of the basin is an almost unbroken line formed by the Sahyadri range of the Western Ghats, from 600 to 2100 m height. It has the heaviest rainfall and the dampest climate in the basin. Hardly 50 to 60 km. east of the ghats lie the sparsely cultivated and undulating plains of the Deccan, with a dry climate.

About 64 km. from its source, the Godavari receives the waters from Dharna, on its right bank and a short distance lower down the Kadana joins it from the left. The combined waters of the Pravara and Mula which rise in the hills of Akola join the river about 217 km. from its source, About 338 km. lower down, while still in Maharashtra, the river receives the combined waters from the Purna and Dudhna rivers and after a further 138 km. at the border of Maharashtra and Andhra Pradesh, the waters of the Majira river joins it from the south. At this point, Godavari flows at an elevation of about 329 m.

The river Pranhita, conveying the combined waters of the Penganga, the Wardha and Wainganga, which drain Nagpur and the southern slopes of the Satpura ranges, falls into Godavari about 306 km.. Below its confluence with the Majira. Forty eight km. lower, the waters of the Indravathi join the river. Both the Pranhita and the Indravathi are major rivers in their own right. The last major tributary is the Sabari from Orissa, which falls into the Godavari, 100 km. above Rajahmundry.

The largest tributary of the Godavari is the Pranhita with about 34% coverage of drainage area. The Pravara, Manjira and Maner are notable right bank tributaries covering about 16.1%, the Purna, Pranhita, Indravathi and Sabari are important left bank tributaries, covering nearly 59.7% of the total catchment area of the basin. The Godavari in the upper, middle and lower reaches make up for the balance of 24.2%.

Urban Centres: Nagpur is the most important urban centre in the basin. Other important towns in the area are Nasik, Aurangabad, Warangal, Rajamundry, Akola, Amravati, and Ahmednagar.

This basin is working since pre-independence era and a number of interstate agreements exist among basin states on sharing of water of the basin and very often court cases arise on this issue.

Industries: Rich in forests, agricultural and mineral resources, the industrial potential of the Godavari basin is high. A small part of the enormous forest wealth of the basin is at present utilised as timber and in the manufacture of paper and other timber products. Industries based on agricultural produce are the processing of agricultural commodities like rice milling, cotton ginning, pressing, spinning and weaving, manufacture of sugar, manufacture of textiles, extraction of oil from groundnut and other oil seeds. Mining of coal, manganese and other ores is an important activity in the districts rich in minerals. Most of the ores are at present being exported. Small engineering industries are spread all over the area.

The Godavari basin has a rich variety of mineral wealth spread over vast areas. The principal minerals found are bauxite, manganese, iron ore and coal. Other minerals like lead, zinc, corundum, refractory minerals and kaolin are also found in small quantities in different parts of the basin.

Sites: There are 28 water quality measurement sites on the basin and as many as 25 of them are for sediment measurements also. In addition, there are 27 gauge discharge observation stations in the basin.

6. Krishna

Location: The Krishna basin extends over an area of 2,58,948 Sq.km. out of which 27.01% is in Maharashtra, 44.06% is in Karnataka and 28.93% falls in Andhra Pradesh. The basin lies between east longitudes $73^{\circ} 21'$ to $81^{\circ} 09'$ and north latitudes $13^{\circ} 07'$ to $19^{\circ} 25'$ lying in the Deccan plateau. The Krishna rises in the Western Ghats at an altitude of 1337 m just north of Mahabaleshwar, about 64 km. from the Arabian Sea and flows from west to east through the States of Maharashtra, Karnataka and Andhra Pradesh to join the Bay of Bengal. The total length of the river from the sources to its outfall in the sea is about 1,400 km of which 612 km are in Andhra Pradesh, 306 km in Maharashtra and 483 km in Karnataka. Together with its tributaries, the river drains about 708 km. of the Western Ghats, which is its chief source of supply. The Ghataprabha, the Malaprabha, the Bhima, the Tungabhadra and Musi are the principal tributaries. The Krishna Basin's predominant land use is agriculture.

The Krishna basin is bounded on the north by the ridge separating it from the Godavari basin, on the south and east by the Eastern Ghats and on the west by the Western Ghats. The basin is roughly triangular in shape with its base along the Western Ghats, the apex at Vijayawada and the Krishna itself forming the median. All the major tributaries draining the base of the triangle fall into the river in the upper two-thirds of its length.

The interior of the basin is a plateau, the greater part of which is at an elevation from 300 to 600 m. Its general slope is eastwards. Great undulating plains, divided from each other by flat-topped ranges of hills are the main characteristics of this plateau. To the south of the Krishna, the Eastern Ghats comprises parallel ranges, which are the successive outcrops of an ancient series of stratified rocks.

The delta of the Krishna formed by deposits at the mouth of the river over past ages, consists of a wide belt of river-borne alluvium. The process of silt deposition at the mouth of the river is still continuing and the delta is gradually extending into the sea.

About 137 km. from the source, it receives a main tributary, the Koyna, from the western side of the Mahabaleshwar hills. Lower down, the river Yerla falls into the Krishna from the left and then the Varna, the Panchganga and the Dudhganga from the right.

Just near its confluence with Dudhganga and about 306 km. from its source, the Krishna enters Karnataka State. At this point, the bed level of the river at an altitude of about 533 m. and the river has emerged from the heavy rainfall zone along, and near the Western Ghats. After flowing for 201

km. in Karnataka territory, the Krishna receives, from its right, the waters of the Ghataprabha, and 35 km. lower down, those of the Malaprabha. Both these tributaries have their sources in the Western Ghats.

A short distance downstream of its confluence with the Malaprabha, the Krishna drops about 122 m. from the tableland of the Deccan plateau to the alluvial lands of Raichur. The Krishna receives its two major tributaries, the Bhima and the Tungabhadra the former on its left at 789 km. from its source and the latter 129 km. further downstream near Kurnool from its right. Both the Bhima and the Tungabhadra drain large area of the Western Ghats and each is a major river in its own right.

From a short distance below its confluence with the Tungabhadra, the Krishna runs in a deep gorge through a series of hills, for nearly 290 km. before emerging into the coastal belt a pulichintala, at an elevation of about 37 m. above sea level. Beyond this point, the river flows for about 80 km. before it spreads into the delta. Vijayawada is at the head of the delta.

The Dindi and the Musi join the Krishna from its left between Kurnool and Pulichintala and two more tributaries, the Palleru and the Muneru also from the left, fall into the river between Pulichintala and Vijayawada.

Urban Centres: The major cities in the basin are Pune, Hyderabad and Vijayawada and the important towns are Satara, Karad, Sangli, Kolhapur, Sholapur, in Maharashtra state. Bijapur, Gulbarga, Raichur, Bagalkot, Bellary, Belgaum, Dharwar, Hospet, Davanagere, Badravathi Chikkamagulur, Tumkur, Chitradurga, Shimoga in Karnataka state and Mahboobnagar, Kurnool, Nandyala, Nalgonda, Miryalaguda, Khammam, Guntur, Gudivada, Machilipatnam in Andhra Pradesh state.

Industries: There are many large medium and small-scale industries in the catchment. The main industries in the catchment are Textiles, Sugar, Chemical, Cement factories, Automobiles, Engineering goods, Extraction of Gold, Indian Aluminium Company Belgaum, Bharat Heavy Electrical Limited (Hyderabad), Hindustan Machine Tools Limited (Hyderabad), Nuclear Fuel Complex (Hyderabad), Hindustan Cables Limited (Hyderabad), Indian Drugs and Pharmaceuticals Limited (Hyderabad), Bharat Dynamics Limited (Hyderabad), Bharat Electricals Limited (Hyderabad), etc. Among the small-scale industries, engineering works, ferrous and non-ferrous foundries and cotton ginning are important. There are also cottage industries like weaving, carpentry, leather, rope making, tiles, pottery, copper and brass works in the catchment. The important minerals found in the catchment are gold, bauxite, lime stone, iron ore, manganese ore, quartz, copper, red oxide, soapstone, etc.

Sites: There are 35 water quality observation stations in the basin. Sediment observations are also made at 25 stations. In addition, there are 22 gauge discharge observation stations in the basin.

7. Cauvery

Location: The river Cauvery originates at Talakaveri in Coorg District of Karnataka in Brahmagiri Range of hills in the Western ghats at an elevation of 1,341 m. and drains a total of 81,155 Sq.kms. area of which 34,273 Sq.kms. lies in Karnataka, 43,856 sq.kms. in Tamilnadu, 2,866 sq.kms. in Kerala and 160 sq.kms. in the Union Territory of Pondicherry. The Cauvery basin is bounded by Tungabhadra sub-basin of Krishna basin on the northern side and Palar basin on the Southern side. The Western ghats from the Western boundary, the Nilgiris, an offshore of Western ghats, extend eastwards to the Eastern ghats and divide the basin into two natural and political regions i.e. Karnataka plateau in the North and the Tamilnadu plateau in the South. In Tamilnadu, the Eastern part of the basin is in the elevation range of 0 to 150 m sloping gently up from the sea.

At Shivanasamudram, the river branches off into two parts and falls through a height of 91 m. in a series of falls and rapids. The falls at this point is utilised for power generation. The power station at Shivanasamudram was built as early as 1902. The two branches of the river joins after the fall and flows through a wide gorge which is known as "Mekedatu" (Goats leap) and continues its journey and forms the boundary between Karnataka and Tamilnadu States for a distance of 64 kms. At Hogennekkal Falls, it takes southernly direction and enters the Mettur Reservoir, which was constructed in 1934. A tributary called Bhavani joins Cauvery on the Right bank about 45 kms below Mettur Reservoir, thereafter it takes Easternly course to enter the plains of Tamilnadu. Two more tributaries Noyil and Amaravathi join on the right bank and here the river widens with sandy bed and flows as "Akhanda Cauvery".

Immediately after crossing Tiruchirappalli district, the river divides into two parts, the northern branch being called "The Coleron" and southern branch remains as Cauvery and from here the Cauvery Delta begins. After flowing for about 16 kms., the two branches join again to form "Srirangam Island". On the Cauvery branch a Grand Anicut is said to have been constructed by a Chola King in 1st Century AD. Below the Grand Anicut, the Cauvery branch splits into two, Cauvery and Vennar. These branches divide and sub-divide into small branches and forms a network all over the delta.

The total length of the river from the origin to its outfall into the sea is 800 kms. of which 320 kms. is in Karnataka, 416 kms. in Tamilnadu and 64 kms. form the common border between the Karnataka and Tamilnadu states. The Cauvery basin is fan shaped in Karnataka and leaf shaped in Tamilnadu. The run-off does not drain off quickly because of its shape and therefore no fast raising floods occur in the basin. The basin receives rainfall mainly from the S-W Monsoon and partially from N-E Monsoon in

the Karnataka. The basin in Tamilnadu receives good flows from the North-East Monsoon.

The Cauvery river system consists of 21 principal tributaries each with catchment area exceeding 250 sq.kms. The largest of all of them of Catchment area are Shimsha, lying wholly in Karnataka, the Amaravathi rising in Kerala but lying mostly in Tamilnadu and the Kabini rising in both Kerala and Tamilnadu but lying mostly in Karnataka. The Bhavani is the fourth largest and the second longest. It rises in Kerala and Karnataka but lies mostly in Tamilnadu. The longest tributary, the Hemavathi (245 kms.) is the fifth largest in catchment area and lies wholly in Karnataka.

From the point of view of flow contribution to the system, apart from the head reach of the Cauvery main, the most important tributaries are i) the Hemavathi, ii) the Kabini and iii) the Bhavani.

There are disputes in sharing of this river water among states.

Urban Centres: Important cities on the basin are Coimbatore, Bangalore & Tiruchirapalli.

Industries: Some of the main industries in the basin are Paper mills, Sugar mills, Chemical Factories, Cotton mills, Steel & Cement factories, etc.

Mining activity in the basin includes Stone mining for building construction works.

Sites: There are 16 Water Quality observation stations in the basin. Sediment observations are also made at 11 of these stations.

8. East flowing rivers

The basin of east flowing rivers consists of all small independent river basins of peninsular India lying to the south of Krishna basin except Cauvery basin. It lies within $8^{\circ} 12'$ to $15^{\circ} 56'$ north latitude & $77^{\circ} 29'$ to $79^{\circ} 59'$ east longitude. All these rivers are draining into the Bay of Bengal.

The basin of East flowing rivers covers large areas in the states of Andhra Pradesh, Tamilnadu and a small area in the state of Karnataka. There are eleven river basins of which the Palar and Ponniyar are more important. Other river basins are the Pellar, Vellar, the Vaigai, the Vaippar, and the Tambraparani. Brief descriptions of these river basins are given below.

i) The Palar

The Palar basin is an important basin among the 12 basins lying between the Pennar and the Cauvery basins. This basin is divided into three major topographical divisions namely, (i) the hill ranges of Eastern Ghats (ii) the plateau region and (iii) the coastal plains. Though most of the drainage area lies in Tamilnadu, its drainage area extends also to cover the southeast and southwest parts of Karnataka and Andhra Pradesh respectively. The shape of the basin is rhombus and lies approximately between $12^{\circ} 15'$ and $13^{\circ} 38'$ north latitudes. The basin finds its outlet in to Bay of Bengal.

The Palar drains an area of 17,871 sq.kms. out of which nearly 57 percent lies in Tamilnadu and the balance in the states of Karnataka and Andhra Pradesh.

ii) The Ponniar

The Ponniar basin is the second largest interstate East Flowing river basin among the 12 basins lies between the Pennar and the Cauvery basins. It covers a large area in the state of Tamilnadu, besides the areas covered in the states of Karnataka and Andhra Pradesh. It lies between the east longitudes $77^{\circ} 33'$ to $79^{\circ} 47'$ and north latitudes $11^{\circ} 45'$ to $13^{\circ} 30'$. This basin is bounded on the north west and south by various ranges of the Eastern Ghats like the Velikonda range, the Nagari hills, the Javadu hills, the Shevaroy hills, the Chitteri hills and the Kalrayan hills and in the east by the Bay of Bengal. The Ponniar basin is elongated in shape and finds its outlet in to the Bay of Bengal.

The Ponniar drains an area of 16,019 Sq.kms. out of which nearly 77 percent lies in Tamilnadu.

The Ponniar or the Dakshina Pinakini river rises near Hongashenhalli village at an elevation of about 900m above m.s.l. at north latitude $13^{\circ} 25'$ and east longitude $77^{\circ} 58'$ in the Kolar district of Karnataka state. From its origin, the river Ponniar generally flows in the southern direction through the Kolar and Bangalore districts of Karnataka to a length of 79 km before entering the Dharmapuri district of Tamilnadu. The river flows another 247 kms. generally in the south easterly direction in the districts of Dharmapuri, Vellore, Tiruvannamalai, Cuddalore and Villupuram districts, then the river flows in the easterly direction below the Tirukoyilur anicut for another 70 kms. before finding its way into the Bay of Bengal. The river Ponniar branches into two, the Gadilam near Cuddalore and the Ponniar near the Union Territory of Pondicherry. On its way the river Ponniar receives a number of small streams and rivulets.

iii) The Vellar

The Vellar river rises at an elevation of 900 m near the village of Tumba in the Chittori hills, of the Eastern Ghats in the Salem district of Tamilnadu. It flows generally in an easterly direction for a total length of 210 Km through the Salem & Cuddalore districts in Tamilnadu and finally out falls into the Bay of Bengal near Porto Nova in Cuddalore district. It drains a total catchment area of about 8,922 sq.kms. The catchment area lies entirely in Tamilnadu. The Gomukinadhi and Manimukthanadi are the important left tributaries and Swetanadhi and Chinnar are the right tributaries of the Vellar.

iv) The Vaigai

The Vaigai basin is an important basin among the 12 basins lying between the Cauvery and Kanyakumari. The basin is bounded by the Varushanadu hills, the Andipatti hills, the Cardaman hills and the Palani hills on the west and by the Palk Strait and Palk Bay on the east. The basin lies between $9^{\circ} 17'$ to $10^{\circ} 22'$ north latitudes approximately. This basin is divided into two major topographical divisions namely (i) the hilly areas and (ii) the plains. The basin is elongated in shape and drains into the Palk Bay. The Vaigai drains an area of 7,741 Sq.kms., which entirely lies in the state of Tamilnadu.

The Vaigai river on the western slopes of the Varushanadu hills at an elevation on 1,200m above m.s.l. near Kottaimalai in the Madurai district at a north latitude $9^{\circ} 32'$ and east longitude $77^{\circ} 23'$ and flows in the northerly and north easterly directions up to its confluence with the Varahanadhi and then takes a turn towards the east and south east to flow through Madurai, Sivakangai and Ramanathapuram districts. After traversing about 258 kms. the river Vaigai discharges into Ramnad big tank and some other

tanks. The surplus water from the tanks finally discharges into the Palk Bay near Mandapam. On its way the Vaigai receives two important tributaries namely the Suruliyar and the Manjalar on its left bank, besides a large number of small streams and rivulets. The river has been dammed down stream of its confluence with the Suruliyar.

The Suruliyar and the Manjalar, the two important left bank tributaries together account for nearly 20 percent of the total catchment area of the Vaigai. The Suruliyar the principal tributary of the Vaigai also rises in the eastern slopes of the Varushanadu hills and flows in the north and northeasterly direction. It receives Theniar on its left bank, just before its confluence with the Vaigai. The Manjalar another major tributary rises in the Palani hills and flows generally in the easterly direction before joining the Vaigai below the Vaigai dam. The Vaigai also receives another minor tributary namely the Varshanadhi on its left bank below the Vaigai dam.

v) The Vaippar

The Vaippar river rises on the eastern slopes of the Varushanadu hill ranges of the Western Ghats near Sivagiri in Thirunelveli district in Tamilnadu at an elevation of about 900m. It flows generally in an easterly direction for a length of about 125 kms. through Thirunelveli, Virudhunagar and Tuticorin districts in Tamilnadu and joins the gulf of Mannar near Kalattur. The river basin is located on south of Vaigai. It drains a total catchment area of 5,069 sq.kms. The catchment area lies entirely in Tamilnadu.

The Arjuna-nadhi and Vijnanadhi are the important tributaries. Both the tributaries are left tributaries. There are four anicuts in the basin. No large storages exist in this basin.

vi) The Tamraparni

The Tamraparani river rises on the eastern slopes of the Western Ghats at an elevation of about 1,400m at north latitude $8^{\circ} 46'$ and east longitude $77^{\circ} 15'$ near Alwarkurichi village in Thirunelveli district of Tamilnadu to flow in a generally easterly direction for a total length of 130 kms. and joins the Gulf of Mannar. The Chittar and Manimuthar are the left & right bank tributaries of this river. The total area drained by the Tamraparani is 5,482 sq.kms.. There are number of anicuts across this river of which the more important are the Marudur and the Srivaikuntam anicut systems. Papanasam Hydro Electric Project and Manimuthar Dam are two important storages in this river.

Other small river basins in the east flowing rivers are as under:

a) The Gundalakamma

The Gundalakamma river rises near Iskagundam village in Kurnool district at an elevation of 600m from the eastern slopes of the Nallamala hills at north latitude $15^{\circ} 38'$ and east longitude $78^{\circ} 47'$ and flows in a north-east, east and southern direction for a total length of 220 kms. to join the Bay of Bengal. The total area drained by this river is 8,494 sq.kms. The Kandleru is its important left bank tributary.

b) The Paleru

The Paleru river rises near Gogulapalle village in Nellore District at an elevation of 325m at North Latitude $15^{\circ} 17'$ and East Longitude $79^{\circ} 13'$ and flows in an easterly direction for a total length of 104 kms. to join into the Bay of Bengal. The Paleru drains an area of 2,483 sq.kms.

c) The Pennar

The Pennar river is one of the major East Flowing rivers in Southern India. It rises in the Chennakesava hill of the Nandidurg range in Karnataka, flows in the north westernly direction through the Kolar and Tumkur districts of Karnataka, it enters Andhra Pradesh in the Hindupur taluk of Anantapur district, runs eastwards before draining into the Bay of Bengal near Nellore. The Basin lies between east longitude $77^{\circ} 04'$ to $80^{\circ} 10'$ and north latitude $13^{\circ} 16'$ to $15^{\circ} 52'$.

d) The Swarnamukhi

The Swarnamukhi is an East Flowing river basin having a small catchment Area of 3,225 sq.kms.. It rises at an elevation of 300m in the Eastern Ghat ranges near Pakala village in Chittur district of Andhra Pradesh at North latitude $13^{\circ} 28'$ and east longitude $79^{\circ} 09'$. It runs generally in north eastern direction passing through the famous Tirupati hills before joining into the Bay of Bengal. Its total length is 130 kms.. This Independent river has no major tributaries and therefore its flow depends only on rainfall in its upper catchment.

e) The Kalingi

The river Kalingi is one of the East flowing rivers in Andhra Pradesh. It originates near Kalashasti in Andhra Pradesh and drains completely in Andhra Pradesh and joins in Pulicat lake after Sulurpet. The catchment area of Kalingi river is 5,927 sq.kms. and the length is 76 kms.. The important tributary is Kalleru river which joins Kalingi river after Sulurpet

town. At present there are two medium irrigation projects in this basin namely (1) Kalingi Reservoir and (2) Thanyali Anicut which irrigate an area of 4,650 acres and 10,000 acres respectively.

Industries: Agriculture based industries are located on this basin area.

Site: There are 24 water quality observation stations in the basin. Sediment observations are also made at 6 of these stations. In addition, one gauge discharge observation station is also there in the basin.

9. West flowing rivers

The basin of West flowing rivers consists of all small independent river basins of peninsular India lying to the south of Krishna basin, except Cauvery basin. There are about 22 rivers basins and they are located within $8^{\circ} 43'$ to $19^{\circ} 10'$ North latitude and $73^{\circ} 15'$ to $76^{\circ} 51'$ East longitude. These rivers are draining into the Arabian Sea.

The basin of the West Flowing rivers located in the South West corner of the peninsular India covers areas in the states of Maharashtra, Karnataka, Tamilnadu and Kerala. There are a number of medium and minor river basins in this region. All the rivers originate from the high mountains of the Western Ghats and exhibit similar characteristics. They have steep high banks, which rarely overflow or cause floods.

Important west flowing river basins are described as under.

i) The Bharathapuzha

The Bharathapuzha river is the second longest west flowing river that drains into the Arabian Sea in Kerala State. This basin is bounded in the east by the Cauvery basin and in the west by the Arabian Sea. The basin lies approximately between $10^{\circ} 26'$ and $11^{\circ} 13'$ north latitudes and $75^{\circ} 53'$ to $77^{\circ} 13'$ east longitudes. Its drainage area is spread over the two states namely Tamilnadu and Kerala. The basin is elongated in shape and finds its outlet into the Arabian Sea.

The total drainage area of the basin is 6,186 sq.kms.. Out of which nearly 71 percent lies in the Kerala State.

ii) The Periyar

The Periyar 244 kms. in length is the longest river of Kerala and drains an area of 5,398 sq.kms. It rises at the forest land Sivagiri peak 80 kms. south of Devikulam at an elevation of 2,438m above m.s.l. and traverses the steep mountainous terrain before it is joined by the Mullaiyar, 16 kms. downstream. The river then turns west and continues to flow in the direction for about 16 km. in a sandy bed. After a winding course of about 13 kms., the river reaches Vandiperiyar and passes through a second narrow gorge below which the Perumthura joins it. Further down, it is joined by six tributaries after which the important tributary Edmala joins the Periyar. Passing Malayattur and thereafter taking a meandering course, the river reaches Alwaye where it divides itself into two branches. The upper branch joins the Chalakudi river at Punthenvelikara and then expands into a broad sheet of water at Munambham. The other branch taking a southerly

course is broken up into a number of small channels, which fall into the Vembanad Lake as Varapuzha.

iii) The Ulhas

The Ulhas river is one of the West Flowing rivers in Maharashtra falling into the Arabian Sea. The boundary of the basin consists of the main Sahyadri hills on the east, westerly off shoots on the north and south and on the west, a narrow opening at the end leading to the sea. The Ulhas basin lies between north, latitudes of $18^{\circ} 44'$ to $19^{\circ} 42'$ and east longitudes of $72^{\circ} 45'$ to $73^{\circ} 48'$.

The Ulhas drains an area of 4,637 sq.kms. which lies completely in Maharashtra. The Thane, Raigad and Pune districts fall in the basin. The Ulhas rises from Sahyadri hill ranges in the Raigad district of Maharashtra at an elevation of 600m above m.s.l. The total length of this west flowing river from its origin to its outfall in to the Arabian Sea is 122 kms.

The important tributaries of the Ulhas river are Pej, Barvi Murbari, Kalu, Shari, Bhasta, Salpe, Poshir and Shilar. The Kalu and Bhasta are the major right bank tributaries which together accounts for 55.7% of the total catchment area of Ulhas.

There are mainly two completed projects on the tributaries of the Ulhas river on Bhivapuri and on Barvi. Two ongoing projects are on Bhates and Poshir.

iv) The Netravathi

The Netravathi rises between Kudermukh and Ballalaryan Durga in the Dakshina Kannada district of Karnataka at an elevation of about 1000m at $75^{\circ} 20'$ East longitude and $30^{\circ} 10'$ North latitude flows in a generally north-south direction for 40 kms. up to Gohattu, where it takes a turn towards the west and flow in a generally east-west direction practically up to its outfall into the Arabian Sea near Mangalore. The Kumaradhara, a major left-bank tributary joins it near the village Uppinangadi. The total length of the Netravathi is 103 kms. from its source to the outfall. The river drains an area of 3,657 sq.kms.. No major project is in existence in this basin. However, the investigation for the project titled multi-purpose Netravathi Anicut Scheme has been completed.

v) The Chaliyar

The Chaliyar, known in the lower reaches, as the Beypore is one of the major rivers of Kerala. The main river starts from the Elambalari hills at an

altitude of 2,067m above m.s.l. It is formed by the confluence of numerous streams and rivers. Its important tributaries are the Cherupuzha, the Kurumbanpuzha, the Kanhirapuzha, The Punnapuzha, the Karimpuzha, the Vadapurampuzha, the Chaliyarpuzha. The Chaliyar flowing for a total length of about 169 kms. finally joins the Arabian Sea at Beypore. The river drains a total area of about 2,933 sq.kms. of which 388 sq.kms.. lies in Tamilnadu.

vi) The Pamba

The Pamba, 176 kms in length is the third longest river in Kerala. It is formed by the confluence of the Pamba Aar, Kaki Aar, Arudhai Aar, Kakkad Aar and Kall Aar. The Pamba Aar rises in the Peermedu Plateau at an elevation of 1,670m. The Kaki Aar, which forms the major tributary of the Pamba river is a much larger stream at the beginning than the main river. The Pamba river, after receiving the Kaki Aar flows in a Westerly direction till the Arudhai Aar joins it. At Narayananamuzhi, it turns and follows a south-eastern direction until the Kakkad Aar joins it. Beyond the confluence, the river flows in a southerly direction up to Vadasserikkara where it is joined by the Kall Aar, which has its origin in the Valanjakkatti Malai. The catchment area of the river is 2,235 sq.kms..

At Pandanad the river bifurcates, one branch taking a westerly course. The Manimala joins the Pamba in its Neeretupuram branch. The river thereafter flows northwards and falls into the Vembanad lake through several branches.

At present there are two completed structures in Pamba basin.

vii) The Valapatanam

The Valapatanam river rises south of Ammatti village in the district of Coorg in Karnataka State at $75^{\circ} 52'$ east longitude $12^{\circ} 13'$ north latitude at an elevation of 900 m above m.s.l. The river has a total length of 101 kms. from its source to its fall into the Arabian sea. The river drains an area of 1,867 sq.km.. of which 546 sq.kms. lies in Karnataka and rest in Kerala.

The multipurpose Kattampally project at Kattampally, and Pazhassi project at Valiambra are the main irrigation Projects in this basin. The Kattampally project has been planned in two stages. The stage I will not only prevent saline water intrusion and reduction of flood, but also provide irrigation benefits to an area of 1,280 ha. The second stage of the project is expected to irrigate an additional area of 1,650 hectares. The Pazhassi project is proposed to irrigate 16,110 hectares of land.

vii) The Chalakudi

The Chalakudi river has its origin from the Anamalai hills of Western Ghats. It is formed by the confluence of five streams namely the Parambikulam, the Kuriarkutty, the Sholayar, the Karappara and the Anakayam. The river has a length of 130 kms. The total drainage area of the river is 1,704 sq.kms. of which 300 sq.kms. lies in Tamilnadu and the rest is in Kerala.

The Chalakudi river diversion scheme with a weir across the Chalakudi river at Thumbeurumuzhi is the only Major irrigation scheme in existence in the basin. Presently the project is irrigating an area of 13,500 hectares of land and has a potential to irrigate 19,696 hectares ultimately in the Karuvannur, Chalakudi and Periyar basins.

Next to the Periyar and Pamba basin the Chalakudi basin offers the maximum scope for hydel power development.

ix) The Kallada

The river is formed by the three rivers i.e. Kulathupuzha, Chendurni and Kalthuruthy joining together near Parappar. The river has its origin in Papanasam range south of Kulathupuzha in Quilon district of Kerala State at an altitude of 900 m above m.s.l. The river has a length of 121 kms. and drains an area of 1,699 sq.kms. before confluencing with the Ashtamudilake. The Kallada irrigation project is the one existing major project in the basin. The releases from Kallada dam are used to generate electricity.

There are other small 13 river basins on west flowing rivers and their drainage area varies from 165 sq.kms. to 1,550 sq.kms.

Industries: Mainly agriculture based industries are located in these basins.

Sites: There are 26 Water Quality observation stations in west flowing river basin. Sediment observations are also made at 17 of these stations. In addition, there are six gauge discharge observation stations in the basin.

10. Tapi

Locaton: The Tapi is the second largest westward draining inter state river basin. It covers a large area in the State of Maharashtra besides areas in the states of Madhya Pradesh and Gujarat. The Tapi Basin is the northern-most basin of the Deccan plateau and is situated between latitudes 20° N to 22° N approximately. The Satpura range forms its northern boundary whereas the Ajanta and Satmala hills form its southern extremity. Mahadeo hills form its eastern boundary. The basin finds its outlet in the Arabian Sea in the west. Bounded on the three sides by the hill ranges, the river Tapi, along with its tributaries, more or less flows over the plains of Vidarbha, Khandesh and Gujarat.

The Tapi River drains an area of 65,145 sq.kms. out of which nearly 80 percent lies in Maharashtra state.

The Tapi river originates near Multai in Betul district at an elevation of 752 m above m.s.l. The total length of this west flowing river from its origin to its out fall into the sea is 724 km. For the first 282 km the river flows in Madhya Pradesh, out of which 54 km forms the common boundary with Maharashtra State. It flows for 228 km in Maharashtra before entering Gujarat. Traversing a length of 214 km in Gujarat, the Tapi river joins Arabian sea in the Gulf of Cambay after flowing past the Surat city. The river receives tidal influence for a length of about 25 km upstream from the mouth.

The Tapi river receives several tributaries on both the banks. There are 14 major tributaries having a length more than 50 km. On the right bank, 4 tributaries namely the Vaki, Gomai, Arunavati and Aner join the Tapi river. On the left bank, 10 important tributaries namely the Nesu, Amaravati, Buray, Panjhra, Bori, Girna, Waghur, Purna, Mona and Sipna drain into the main channel. The drainage system on the left bank of the Tapi river is, therefore, more extensive as compared to the right Bank area.

The Purna and the Girnma, the two important left bank tributaries together account for nearly 45 percent of the total catchment area of the Tapi river. The Purna is the principal tributary of the Tapi river originating in Betul district in Gawilgarh hills of the Satpura range, mostly drains the three districts of Vidarbha, namely Amravati, Akola and Buldhana. The Girna, another major tributary, rises in the western Ghats and drains Nasik and Jalgaon districts of Maharashtra.

Urban Centres: Surat is the most important city in the area. Other cities are Amravati, Malegaon, Akola, and Jalgaon.

Industries: Important industries in the basin are textile factories in Surat and newsprint factory at Nepanagar. Other industries are machine tools, drugs & pharmaceuticals, plastics, paper & sugar mills, Dal, Oil & Shaw Mills.

Sites: There are 12 Water Quality observation sites are in the basin. Sediment observations are also made at 8 of these stations.

11. Narmada

Location: The Narmada is the largest west flowing and seventh largest river of India. It drains an area of 98,796 sq.kms. out of which nearly 87% lies in Madhya Pradesh besides some areas in the states of Maharashtra and Gujarat. The Narmada basin lies between east longitudes $72^{\circ} 32'$ to $81^{\circ} 45'$ and north latitudes $21^{\circ} 20'$ to $23^{\circ} 45'$. It flows through Deccan trap in between Vindhya and Satpura ranges of hills before falling into the gulf of Cambay in the Arabian Sea.

The Narmada rises from a Kund (spring) at an elevation of 1057m. at Amarkantak in the Maikal hill in Shahdol district of Madhya Pradesh and flows through Madhya Pradesh, Maharashtra and Gujarat between Vindhya and Satpura hill ranges before falling into the gulf of Cambay in the Arabian Sea about 10 km north of Bharuch district of Gujarat. The total length of this west flowing river from its origin to its outfall into the Sea is 1,312 kms. For the first 1,079 kms. it runs in Madhya Pradesh and thereafter it forms the common boundary between Madhya Pradesh and Maharashtra for 35 kms., and Maharashtra and Gujarat for 35 kms. In Gujarat State it stretches for 159 km.

There are 41 important tributaries to the Narmada River. Significant among them are Burhner, Banjar, Hiran, Tawa, Chhota Tawa, Orsang and Kundi which are major tributaries having catchment area of more than 3,500 sq.kms each. The remaining tributaries are having catchment areas ranging from 500 to 2,500 sq.kms.

Urban Centres: Jabalpur town is the main city in this basin area. The second largest urban pocket in the Narmada is Bharuch of Gujarat. Other urbanized centers are Khandawa and Dewas of Madhya Pradesh.

Industries: There are about 40 large scale and 70 small-scale industries in the area. But compared to other basins, industrialisation is thin in this area. Important minerals found in the basin are Bauxite, Clay, coal, dolomite, graphite, iron ore, manganese, talc & limestone, etc.

Sites: There are 21 Water Quality observation sites are in the basin. Sediment observations are also made at 13 of these stations. Further, there are 31 gauge and discharge sites being maintained by State Government of Gujarat in Narmada basin.

12. Mahi, Sabarmati, Luni and other west flowing rivers Basin

West flowing river basins, excluding those of Narmada & Tapi, considered here consist of 14 rivers namely Mahi, Sabarmati, Luni and other small river basins. The salient features of major 8 basins are explained below.

i) The Mahi

The river Mahi is one of the major west flowing interstate rivers of India, draining into the Gulf of Cambay. The basin is bounded on the North and the North - West by Aravalli hills, on the East by the ridge separating it from the Chambal Basin, on the South by the Vindhya range and on the West by the gulf of Cambay. The basin has a maximum width of about 250 kms. The river Mahi originates on the Northern slope of Vindhya range at latitude $22^{\circ} 35' N$ and longitude $74^{\circ} 58' E$ near the village of Sardarpur in the Dhar District of Madhya Pradesh at an elevation of 500 m above m.s.l. Its length is 583 kms. and it traverses the states of Madhya Pradesh, Rajasthan and Gujarat.

The river Mahi drains an area of 34,842 sq.kms. Initially the river flows Northwards through Dhar and Jhabua districts of M.P. and then turns left and passes through the Ratlam district of M.P., then turning to North - West, it enters the Banswara district of Rajasthan and flows in South-West directions and thereafter enters the Panchmahal district of Gujarat state. Then the river continues to flow in the same direction through Kheda district of Gujarat and finally falls into Gulf of Cambay in Arabian Sea.

ii) The Luni

The Luni is the only river basin of any significance in Western Rajasthan which forms the bulk of arid zone. Luni originates from Western slopes of the Aravalli ranges at an elevation of 772 m above m.s.l. near Ajmer flowing in South West direction and traversing a course of 511 kms. in Rajasthan, it finally flows into the Rann of Kutchh. Its total catchment area falls in Rajasthan. Luni basin is situated in between $24^{\circ} 11'$ to $26^{\circ} 43'$ North latitude and $70^{\circ} 37'$ to $74^{\circ} 39'$ East longitude approximately. The peculiarity of this river is that it tends to increase its width rather than deepening the bed because the banks are of soils which are easily erodable whereas beds are of sand. The floods develop and disappear so rapidly that they have no time to scour the bed. The Aravalli ranges form its East boundary whereas main course of river in Barmer district itself forms North boundary and mostly Banas and initial reach of Chambal river form its Southern boundary. Luni receives all the main tributaries on its left bank except one i.e. Jojari (Mithri) on the right bank. Luni receives ten tributaries namely Lilari, Guhiya, Bandi (Hemawas), Sukri(Hemawas), Mithri, Jawai, Khari

Bandi, Sukri Bandi and Sugi. Hence the drainage on the left bank of Luni is, therefore, more extensive than on Right Bank. The Luni drains an area of 32,879 sq Kms. In Rajasthan state only.

iii) The Sabarmati

The river Sabarmati is one of the major West flowing interstate rivers in India, draining into the Gulf of Cambay. The basin is bounded by Aravalli hills in the North and North-east, by ridge separating it from basins of minor streams and draining into Rann of Kutchh and Gulf of Cambay in West and by Gulf of Cambay in South. The basin has a maximum length of 300 km and maximum width of 105 kms. It is triangular in shape with the main river as the base and the source of the Watrak as the apex point. It originates in the Aravalli hills at latitude $24^{\circ} 40'$ N and longitude $73^{\circ} 20'$ E in the Rajasthan State at an elevation of 762 m above m.s.l. The river Sabarmati drains an area of 21,674 sq kms. with a total length of 371 kms..

The Sabarmati river with its origin in Rajasthan flows generally in south west direction. It enters the Gujarat State and passes through the plains and continues to flow in the same direction and joins the Gulf of Cambay in the Arabian sea.

iv) The Banas

The river Banas originates from Aravalli hills and descends in a South-Western direction through Rajasthan state and travels through Banaskantha and Mehsana district of Gujarat before it drains into little Rann of Kutchh. The Banas basin is the Northern basin and is situated between $23^{\circ} 30'$ & $24^{\circ} 55'$ North latitudes and $71^{\circ} 15'$ to $73^{\circ} 15'$ East longitudes approximately. Saraswati and Luni basins form the Southern and Northern boundaries of this basin. The Aravalli hills form its eastern extremity. The Basnas drains an area of 8,674 sq.kms. out of which nearly 37.69% lies in Rajasthan state and remaining 62.31% falls in Gujarat state.

The Banas river rises near Pindwara of Sirohi district of Rajasthan at an elevation of 372.51m above m.s.l. Little Rann of Kutchh is the outfall of Banas river. Sipu is the only right bank tributary of Banas river which drains into the main channel. There are 6 tributaries on the left bank of Banas river namely the Batria, the Sukli, the Sewaran, the Suket, the Balaram and the Khari which drain into the main channel. Hence the draining system on the left bank of the Banas river is more extensive as compared to the right area. The Sipu and the Khari are the two important right and left bank tributaries which together drain nearly 37% of the total catchment area of Banas.

v) The Bhadar

Bhadar is one of the major rivers of Saurashtra and it drains about 1/7th of the area of Saurashtra. The Bhadar basin is the South Western basin and situated between 21° 25' to 22° 10' North latitude and 69° 45' to 71° 20' East longitude. The river Bhadar originates at an elevation of 261 m above m.s.l. in Vaddi about 26 kms. North-West of Jasdan in Rajkot district and flows towards South upto Jasdan village and then turns towards South-West upto village Jetpur and finally changes its direction towards West till its confluence with Arabian sea at Navibandar (Porbandar). Thus from Jetpur to Porbandar the river Bhadar fertiles Rajkot, Jamnagar, Amreli and Junagadh district of Saurastra. The river drains an area of 7,094 sq kms. out of which 706 sq. kms. in hilly and the rest in plain regions of Saurashtra.

The total length of this South West flowing river from its origin to its outfall into the sea is 198 kms.. For the first 150 kms. the river flows in Rajkot district and the rest of 48 kms. in Junagadh district. The river receives tidal influence for a length of about 26 kms. from mouth in Junagadh district. The river Bhadar receives several tributaries on both the banks. There are 9 major tributaries having a length of more than 25 kms. out of which 6 tributaries namely Gondali, Chapparwadi, Phopal, Utawali, Moj and Venu are feeding from right and the remaining 3 tributaries namely Vasavadi, Surwa and Galolia from left. The drainage system on the right bank of river Bhadar is more extensive as compared to the left bank.

vi) The Shetrunji

The Shetrunji is one of the major rivers of Saurashtra. The Shetrunji basin is the Eastern most basin of Saurashtra and is situated in between 21° 00' to 21° 47' North latitude and 70° 50' to 72° 10' East longitude. The river Shetrunji originates at Chchai hills is Gir forest of Junagadh district at R.L. 380 m above m.s.l and flows towards East direction till its confluence with Gulf of Cambay near Santhrampur port. The river Shetrunji fertiles the Amerli and Bhavanagar districts and a small area of Junagadh district of Saurashtra. The Shetrunji drains an area of 5,514 sq.kms. out of which more than 50% in Amerli district.

The total length of this East flowing river from its origin to the outfall into the Gulf of Cambay is 182 kms. This river receives tidal influence for a length of 5 kms. from mouth. The Shetrunji receives several tributaries on both banks. There are 9 tributaries having lengths more than 15 kms. Out of which Safara, Shel, Khari and Talaji are the 4 tributaries on the right bank of Shetrunji and the remaining 5 tributaries namely Stali, Thebu, Gagadia, Rajwal and Kharo are on left bank. The drainage system on left

bank of Shetrunji is more extensive as compared to the right bank area. The Stali, Thebi and Gagadia 3 important tributaries feeding from left bank of Shetrunji and drain nearly 34% of total catchment area of river Shetrunji.

vii) The Vaitarna

The river Vaitarna originates from hilly terrains of Maharashtra at Trimbak, district Nasik. After running for 120 kms., in Maharashtra towards West, it falls in the Arabian Sea. The Catchment area of the basin is 3637 sq.km. The complete catchment area is located between East longitude of $72^{\circ} 45'$ to $73^{\circ} 35'$ and North latitude of $19^{\circ} 30'$ to $20^{\circ} 20'$. The main tributaries of this river are Pinjal, Ganjal, Surya, Daharji and Tansa.

viii) Dhadar

The river Dhadar is one of the West flowing rivers in Gujarat state. It originates from Pavagadh hills of Gujarat state and flows through Vadodara and Bharuch districts. The river Dhadar after flowing 87 kms. receives Vishwamitri tributary from right bank at Pingalwada village. After flowing 55 kms it falls into the Gulf of Cambay. The total catchment area of Dhadar basin is 3,423 sq.kms.. It lies between east longitude $72^{\circ} 30'$ and $72^{\circ} 45'$ and north latitude $21^{\circ} 45'$ and $22^{\circ} 45'$. The important tributaries of Dhadar are Vishwamitri and Rangav.

Urban Centres: Ahmedabad & Vadodara are two important cities on west flowing rivers basin.

Industries: In addition to agriculture based industries there are important industries of textile, leather & leather goods, plastic, rubber goods, paper, newsprint, automobile, machine tools, drugs, Pharmaceuticals etc.

Sites: There are 19 Water Quality observation centers in this basin. Sediment observations are also made at 13 of these stations. In addition there are 10 gauge discharge observation stations in the basin.

WATER AND RELATED STATISTICS

1. Water Resources of India

1.1 The Annual precipitation including snowfall is the main source of water in the country and is estimated to be of the order of 4000 Cu. Km. The total water resource potential of the country, which occurs as natural run off in the rivers is estimated at 1869 Cu. Km. considering both surface and groundwater as one system. However, due to various constraints of topography, uneven distribution of resource over space and time, it has been estimated that only about 1122 Cu. Km. including 690 Cu. Km. from surface water resources can be put to beneficial use. However, 370 Cu. Km. of estimated utilizable surface water comes from the non-classified river basins.

1.2 The distribution of water resources potential in the country shows that as against the national per capita annual availability of water of 1731 Cu. M. (estimated as on 1st March 2004) the average availability in Brahmaputra and Barak basin is as high as 14057 Cu. M. while it is as low as 308 Cu. M. in Sabarmati basin in 2000. Brahmaputra and Barak basin with 7.6 % of geographical area and 5.2 % of population of all the basins in the country has 31 % of the annual water resources. Per capita annual availability for rest of the country excluding Brahmaputra and Barak basin works out to about 1345 Cu. M.. Any situation of availability of less than 1000 Cu. M. per capita is considered by international agencies as scarcity conditions. Cauvery, Pennar, Sabarmati, East flowing rivers and west flowing rivers are some of the basins which fall into this category.

2. Drainage/catchment area and population distribution.

2.1 The 12 non-classified river basins cover an estimated population of 50 crores on 1st March 2004 accounting for 46% of total population of India. The drainage area of these basins account for 43% of the total geographical area of the country. The Godavari basin has the highest drainage area of 3,12,800 Sq. Kms. followed by Krishna basin with drainage area of 2,58,948 Sq. Kms. and Mahanadi basin with drainage area of 1,41,600 Sq. Kms. The river basins of Rushikulya (7,700 sq. kms.), Vamsadhara (10,830 sq. kms.), Sarda (2,665 sq. kms.) and Nagavali (9,510 sq. kms.) together have the least total drainage area of 30,705 Sq. Kms.

The population wise, the East flowing rivers have the highest population of 9.86 crores followed by Krishna (7.65 crores), east flowing rivers (7.35 crores) and Godavari with 6.8 crores. West flowing rivers have the maximum population density of 846 persons per Sq. Km. followed by east flowing rivers (722 persons per Sq. Km.). Narmada has the least population density of 187 persons per

Sq. Km. followed by Godavari basin with density of 217 persons per Sq. Km.

2.2 The average annual potential/average annual flow in non-classified river basins is maximum at 113.53 Cu. Km. in West Flowing rivers from Tadri to Kanyakumari followed by 110.54 Cu. Km. at Godavari basin and 87.41 Cu. Km. in West Flowing Rivers from Tapi to Tadri. The run off at terminal site is, however, maximum at Polavaram in Godavari (88728 MCM.), followed by 68824 MCM in West Flowing Rivers from Tapi to Kanyakumari and 46477 MCM in Mahandi Basin at Tikrapara. The site wise distribution is given in Table 1.1.

2.3 Surface Water Storage

So far a total storage capacity of 212.79 Cu. Km. (Table 1.3) has been created in India and the projects under construction will add up another 76.26 Cu. Km. The reservoir projects under consideration will contribute further about 107.54 Cu. Km. of water storage capacity. Therefore expected storage capacity would be 376 Cu. Km. against total availability of 1869 Cu. Km. of water in the river basins of this country. The Krishna basin leads in term of storage capacity (49.55 Cu. Km.) followed by Godavari basin (31.33 Cu. Km.) and Narmada basin (23.60 Cu. Km.). Pennar basin leads (76%) in terms of storage capacity created as percentage of average annual flow followed by Tapi basin (71%) which even otherwise has requirement for higher storage capacity as it covers the semi desert areas of Madhya Pradesh, Maharashtra & Gujarat. The West Flowing Rivers of Kutch, Shaurashtra including Luni, Krishna, Narmada and Brahmani & Baitarni basins exceed 50% capacity of their respective average annual flow. The storage percentage is, however, less than 25% in few basins and hence there is a scope for increasing storage potential in them particularly for those basins for which the annual average flow is higher. This publication presents data on average annual runoff at terminal sites of all basins with catchment area upto the site (Table 1.1).

3. Details of other information

3.1 Observations on water discharges, volume of sediments deposited on the flow areas & examinations of water qualities are made at different water releasing points of the river basins. Geographical locations of observation sites, types of experiments done on those sites and dates of commencement of experiments are also given for understanding distribution of waters on participating States. There are 57 (Table 1.2) such sites on Krishna basin out of 286 sites and 56 sites in Godavari basin. Rushikulaya & other small three rivers altogether have only 5 observation centres.

3.2 Live storage capacities in respect of different river basins are given in table 1.3.

3.3 Site-wise further details of findings in terms of seasonal & annual flow of water for last ten years and historical extreme levels like maximum & minimum water levels & discharges, from the times of commencements of observations to latest information available, are presented as time series data in table 1.5 .

3.4 Site-wise maximum and minimum observed water levels and discharges in different river basins are given in table 1.6.

3.5 Expectation of availability of required amount of water is of paramount importance for any plan/project or irrigated cultivation purposes. Therefore dependable flow of water (Table 1.7) at 10 equal percentile levels has been presented here for each site. And the percentiles have been evaluated taking into consideration the whole period of releases of water from the sites from the day of its openings. Monthly average flow of water per unit drainage area (Table 1.8) has also been shown in the publication based on its evaluation for total ages of different sites separately. This will also help in understanding expected water availability in different months of a year.

3.6 The site-wise historical observations on latitude, longitude, stage record, drainage area in these non-classified basins is presented in Table 1.4.

Table No.1.1 : Basins Salient Feature

Sl. No.	Name of the Basin (Origin, Altitude & Length of the River)	State	Drainage Area (Sq.Km)	Principal Tributaries & their Catchment Area		Basin Location		Number of Hydrological Observation Site	Climate Details

SECTION-II
SEDIMENTATION STATISTICS

SECTION - II

SEDIMENTATION STATISTICS

Whenever, water flows in a channel (natural or artificial), it tries to scour its surface. Silt or gravel or even larger boulders are detached from its bed or banks. The moving water sweeps these detached particles downstream. Silting and scouring in channels is not very uncommon and must be avoided by proper designs. Scouring lowers the full supply level and causes loss of command. It may also cause breaching of canal banks and failure of foundations of irrigation structures. Silting interferes with the proper working of a channel as the channel section gets reduced by silting, thereby reducing its discharging capacity.

Development and construction of projects formulated by harnessing the available water resources during last three to four decades has been instrumental in bringing the Green revolution that has essentially made India to achieve self-sufficiency in food and has ushered in an era of prosperity. However, these projects are seriously threatened by sedimentation due to the silt carried by various rivers and streams up to the point of their interception. Sediment is also threatening denudation of our forests. The sediment in a canal is a burden to be borne by the flowing water and is, therefore, designated as sediment load. The sediment may move in water either as bed load or as suspended load. Bed load is that in which the sediment moves along the bed with occasional jumps into the main river. While the suspended load is one in which the material is maintained in suspension due to the turbulence of the flowing water.

Sediment is one of the major obstructions on the flow line or channel of water and unmanageable quantity of it shorten longevity of channels. Moreover, it causes soil-erosion. Therefore, study of sediments and nature of its deposits on downstream are very important for preparation of any water supply projects and for this purpose sound database on sediments are essential tools.

The analysis of suspended sediment sample is carried out for three different grade of sediments, namely, coarse sediment, having particle diameter above 0.2 mm., medium sediment with diameter ranging from 0.075 to 0.2 mm. And fine sediment with diameter less than 0.075 mm.

The water sample from each group is passed through 100/72 mesh sieve (B.S.S). The residue on the sieve is washed with clear water several times, transferred to a crucible and its oven dry weight is measured. This gives the

coarse sediment in the group from which the sediment intensity in gm./lit, for the group is worked out.

After the removal of coarse sediment, the filtrate and washings, which now contain the medium and fine sediment is passed through 200 mesh sieve (B.S.S). Sediment particles retained on the sieve are medium sediment and part of the fine sediment. So, the residue in the sieve is thoroughly washed with clear water several times, transferred to a crucible and its oven dry weight is measured. Medium grade sediment intensity in gm/l for that particular group is worked out, as is done for coarse sediment.

The filtrate and washings after separation of coarse and medium grade of sediment now contain only fine grade of sediment in suspension. The filtrate and washings obtained from all the groups are combined together in an enameled bucket and kept overnight for settlement. About 5 to 10 ml. of 10% alum solution is added to hasten the coagulation of colloidal silt. After the settlement is complete, the supernatant liquid is siphoned off carefully and the reduced volume of suspension is filtered through a dried and pre weighted Whitman No.2 grade filter paper. Extra washings with clear water are given to remove excessive alum, if used. The filter paper along with the residue is dried to its constant weight and weighed. From this weight, weight of the fine sediment in gm/l is determined. The intensity of fine silt in gm/ lit., so obtained, is the amount of the sediment for the entire cross section.

The total sediment load of the river along the cross-section is evaluated from the coarse and medium sediment concentration obtained group-wise and the sediment for the entire cross section. In this section detailed information on quantity of average sediment deposits on the streamlines is presented here separately for all sites on ten daily and monthly basis for last 10 years (table 2.1). In ten-daily summary tables T/D values are rounded off to nearest full integer when more than 1000, nearest first decimal figure when between 100-999 and nearest two decimal figures when less than 100. The frequency of sediment observation is daily during monsoon season and once in a week during the lean period. Data for non -observed days is estimated/ interpolated from the relationship of discharge vs. sediment load prepared on the basis of observed sediment concentration and weighted mean discharge of the same year.

Sediment concentration in gm./lit. (coarse, medium and fine) is recorded in the daily flow tables. The sediment load reported in the 10 daily tables indicates average sediment load. The sediment load as given in the seasonal and monthly summary tables (table 2.2) indicates total sediment load. In monthly and seasonal summary tables sediment load is rounded off to full

integer. The annual/ seasonal sediment yield in mm is the notional depth of soil in mm. over the catchment equivalent to annual/ seasonal suspended sediment runoff calculated at the sediment observation station. It is computed using the relation.

$$\text{Sediment yield (mm)} = \frac{\text{Total suspended sediment load (T)}}{\text{Catchment Area (Km}^2\text{)}} / 1400^*$$

It can be seen that among the basins Godavari (88.822 million metric tones at Pathagudem site) followed by Narmada (73.140 million metric tonnes at Mandleshwar) Basin carries highest amount of sediments compared to others. However, Sediment load deposited is highest on Godavari (2220 Metric Tonnes per Sq. Kms.) basin on unit area basis. It is 1855 Metric Tones per Sq. Kms in Tapi basin and 1004 MT per Sq. Kms. in Narmada basin.

After the removal of coarse sediment, the filtrate and washings, which now contain the medium and fine sediment is passed through 200 mesh sieve (B.S.S). Sediment particles retained on the sieve are medium sediment and part of the fine sediment. So, the residue in the sieve is thoroughly washed with clear water several times, transferred to a crucible and its oven dry weight is measured. Medium grade sediment intensity in gm/l for that particular group is worked out, as is done for coarse sediment.

The filtrate and washings after separation of coarse and medium grade of sediment now contain only fine grade of sediment in suspension. The filtrate and washings obtained from all the groups are combined together in an enameled bucket and kept overnight for settlement. About 5 to 10 ml. of 10% alum solution is added to hasten the coagulation of colloidal silt. After the settlement is complete, the supernatant liquid is siphoned off carefully and the reduced volume of suspension is filtered through a dried and pre weighted Whitman No.2 grade filter paper. Extra washings with clear water are given to remove excessive alum, if used. The filter paper along with the residue is dried to its constant weight and weighed. From this weight, weight of the fine sediment in gm/l is determined. The intensity of fine silt in gm/ lit., so obtained, is the amount of the sediment for the entire cross section.

The total sediment load of the river along the cross-section is evaluated from the coarse and medium sediment concentration obtained group-wise and the sediment for the entire cross section. In this section detailed information on quantity of average sediment deposits on the streamlines is presented here separately for all sites on ten daily and monthly basis for last 10 years (table 2.1). In ten-daily summary tables T/D values are rounded off to nearest full integer when more than 1000, nearest first decimal figure when between 100-999 and nearest two decimal figures when less than 100. The frequency of sediment observation is daily during monsoon season and once in a week during the lean period. Data for non -observed days is estimated/ interpolated from the relationship of discharge vs. sediment load prepared on the basis of observed sediment concentration and weighted mean discharge of the same year.

Sediment concentration in gm./lit. (coarse, medium and fine) is recorded in the daily flow tables. The sediment load reported in the 10 daily tables indicates average sediment load. The sediment load as given in the seasonal and monthly summary tables (table 2.2) indicates total sediment load. In monthly and seasonal summary tables sediment load is rounded off to full

integer. The annual/ seasonal sediment yield in mm is the notional depth of soil in mm. over the catchment equivalent to annual/ seasonal suspended sediment runoff calculated at the sediment observation station. It is computed using the relation.

$$\text{Sediment yield (mm)} = \frac{\text{Total suspended sediment load (T)}}{\text{Catchment Area (Km}^2\text{)}} / 1400^*$$

It can be seen that among the basins Godavari (88.822 million metric tones at Pathagudem site) followed by Narmada (73.140 million metric tonnes at Mandleshwar) Basin carries highest amount of sediments compared to others. However, Sediment load deposited is highest on Godavari (2220 Metric Tonnes per Sq. Kms.) basin on unit area basis. It is 1855 Metric Tones per Sq. Kms in Tapi basin and 1004 MT per Sq. Kms. in Narmada basin.

Annual Sediment Load and Annual Runoff in Different River Basins

SECTION-III
WATER QUALITY STATISTICS

SECTION - III

WATER QUALITY STATISTICS

Water is a prime necessity for human survival and for growth of agriculture as well as for industrial development. Effective management of water resource, monitoring and control of its quality are becoming increasing important for sustainable development and human welfare. Pollution of water has become a universal phenomena in present day world and for maintaining water quality at acceptable levels, Environmental Protection Act also includes, as one of its objectives, protection of water from pollution. Now-a-days greater emphasis is also being given to water quality because of concern of environmentalists. Degradation of water quality is not only caused by increasing inflow of domestic and industrial waste water into water course, but also from the abstraction of water from rivers rendering them dry or with meager flow leading to concentration of pollution.

World Health Organisation (WHO) has classified inland water uses in five classes and has fixed tolerance limits of all polluting factors of water. And following the same Bureau of Indian Standards(BIS) has also fixed the same (table 3.1) in Indian context.

Considering importance of water quality an attempt has been made to present here detailed information about the quality of water being supplied from different reservoirs in India. Maximum & minimum values of as many as 42 water quality parameters (table 3.3) and values of the same crossing tolerance limits are presented here (table 3.2) for reviewing the kind of water being discharged/supplied for different purposes.

From the data it can be seen that water coming through east flowing rivers namely Rushikulya, Vamsdhara, Sarada & Nagavali are in general good for all kinds of uses. Most of the Indian waters are alkaline (i.e. having PH value more than 7.00) and are considered safe for industrial uses especially for boilers, etc.

Comparing with the BIS tolerance limits it can be seen that PH value is exceeding the prescribed limit at many sites of Godavari, Krishna, Cauvery, East flowing rivers and Narmada river basin. Chemically the water flowing through many sites of Godavari, Krishna and Mahi basins is over-limiting the concentration of magnesium, sodium, ammonia and fluorides. Water of Tapi basin is also having higher concentration of sodium.

Compared to west flowing rivers East flowing rivers show moderate to high conductivity. In contrast to west flowing rivers the well waters of east flowing rivers are more alkaline. The waters of west flowing rivers are

generally of good quality with low to medium ionic concentrations, The dissolved Oxygen also confirmed that this water is of good quality.

The Mahanadi water as a whole was good to very good throughout the year and suitable for all purposes. The water of Cauvery basin showed low to high salinity. Silicate was present in good quantity in all the waters. Nitrate, Fluoride, Phosphate anions were present in low concentration throughout the year at all the water quality stations. Brahmani water in the upper reaches upto Panposh is free from biological pollution and the water is good, healthy and suitable for use for all purposes. Observed sodium proportion and low S.A.R. values in Brahmani and Baitarni throughout the year indicate good water for irrigation purpose. The Subarnrekha water upto Jamshedpur is good to very good with some variation during non-monsoon but huge amount of chemical and biological pollutants of waste effluents from Jamshedpur, polluted the Subarnrekha water.

Table No.3.1 : Tolerance limits of releting to selected pollution parameters for Inland Surface Water required for different uses as prescribed by the Bureau of Indian Standards BIS : 2296-1982

Note :

A - Drinking Water source without conventional treatment but after disinfection.

B - Out door bathing organised.

C - Drinking Water source with conventional treatment followed by disinfection.

D - Propagation of wildlife, fisheries.

E - Irrigation, Industrial cooling, Controlled waste disposal.

* If the coliform count is more than the prescribed tolerance limit, the criteria for coliforms shall be satisfied if not more than 20% of samples show more than the tolerance limit specified and not more than 5% samples show more than 4 times the tolerance limit. Further, the faecal coliform should not be more than 40% of the total coliform.

SECTION-IV
LAND USE STATISTICS

SECTION – IV

LAND USE STATISTICS

Land use pattern is a fairly useful indicator in understanding the environmental set up, socio-economic status, infrastructural facilities and climatic conditions of an area. The land use pattern is an outcome of the interaction and interplay of the various physical conditions of the area. It gives not only the land coverage but also an insight into the nature of environmental degradation in the catchment basin. Hence it is considered very important in the environmental study of any area. Various Government Departments for their respective administrative units such as Blocks/Tehsils/Districts mostly compile the information. But information is not available for districts/areas under different basins. It may be possible to work out estimated district wise basin wise area but the available district wise information on land use pattern is also quite back dated and the latest available information relates to 1992-93, which has also already been included in the previous issue. In this issue we have confined our analysis at statewise basinwise information. As we have latest information available on basin area state wise for 1999-2000. The basin wise land utilisation has been estimated as sum total of estimated land use pattern in the area of state falling within a basin worked out in proportion to the area of the state falling in the particular basin to total state area. The data on state-wise land use pattern as published by the Directorate of Economics and Statistics, Department of Agriculture & Co-operation, Ministry of Agriculture has been used for the purpose.

The data has been classified into (i) forest area (ii) area not available for cultivation (iii) other uncultivated lands excluding fallow land (iv) fallow land (v) net area sown (vi) total cropped area and (vii) area sown more than once.

The non-classified river basins cover 163080.6 thousand hectares area (table 4.1) of the states. The west flowing river basin from Kanyakumari to Tapi has the highest total cropped area of about 68 % of its basin area followed by Godavari and Krishna basin with 63%. Similarly west flowing river basin from Kanyakumari to Tapi has highest net sown area of 55% followed by Krishna basin 52%.

Area under forests have been reported highest in Godavari Basin. However it can be seen that around 19% of areas of all

basins together are covered under uncultivated lands including fallow land. Among these basins the East flowing river basin has the highest of about 16% of its area still lying unutilised and if sufficient irrigation water is supplied and proper treatment of land is provided it can be brought under agricultural use.

The explanation, as per Ministry of Agriculture, Government of India, of the terms used in this publication is as under:

A Terms Used in the Publication

- i) Reporting Area for Land Utilisation Statistics** The Reporting area stands for the area for which data on land use classification of area are available. In areas where land utilization figures are based on land records, reporting area is the area according to village papers, i.e. the papers prepared by the village accountants. In some cases, the village papers may not be maintained in respect of the entire area of the State. For example, village papers are not prepared for forest areas for which no village paper exists but, for which ad-hoc estimates of classification of area etc. framed to complete the coverage.
- ii) Forest** This includes all lands classified as forest under any legal enactment dealing with forests or administered as forests, whether state-owned or private, and whether wooded or maintained as potential forest land. The area of crops raised in the forest and grazing lands or areas open for grazing within the forests remains included under the forest area.
- iii) Area under agricultural Uses** **Non-** This includes all lands occupied by buildings, roads and railways or under water, e.g. rivers and canals and other lands put to uses other than agricultural.

- iv) Barren and Un-culturable Land** This include all barren and unculturable land like mountains, deserts, etc. Land which cannot be brought under cultivation, except at an exorbitant cost, is classified as unculturable whether such land is in isolated blocks or within cultivated holdings.
- v) Permanent Pastures and other Grazing Lands** This includes all grazing lands whether they are permanent pastures and meadows or not. Village common grazing land is included under this head.
- vi) Land under Miscellaneous Tree Crops, etc.** This includes all cultivable land which is not included in 'Net area sown' but is put to some agricultural use. Lands under Casuring trees, thatching grasses, bamboo bushes and other groves for fuel, etc. which are not included under 'Orchards' are classified under this category.
- vii) Culturable Waste Land** This includes land available for cultivation, whether not taken up for cultivation or taken up for cultivation once but not cultivated during the last five years or more in succession including the current year for one reason or the other. Such lands may be either fallow or covered with shrubs and jungles which are not put to any use. They may be assessed or unassessed and may lie in isolated blocks or within cultivated holdings.
- viii) Fallow Lands other than Current Fallows** (4) This includes all lands, which were taken up for cultivation but are temporarily out of cultivation for a period of not less than one year and not more than five years.
- ix) Current Fallows** This represents cropped area, which

- are kept fallow during the current year. For example, if any seeding area is not cropped against the same year it may be treated as current fallow.
- x) Net Area Sown**
- This represents the total area sown with crops and Orchards. Area sown more than once in the same year is counted only once.
- xi) Total Cropped Area**
- This represents the total area covered with crops, i.e. the sum total of areas covered by all the individual crops; areas sown with crops more than once during the year being counted as separate areas for each crop. It is also known as Gross Cropped Area.
- xii) Area Sown more than once**
- This represents the areas on which crops are cultivated more than once during the agricultural year. This is obtained by deducting 'Net Area Sown' from 'Total Cropped Area'.

B. DEFINITION OF SOME COMMONLY USED TERMS

- i) Total Cultivable Area**
- This consists of net area sown, current fallows, fallow lands other than current fallows, culturable waste and land under miscellaneous tree crops.
- ii) Total Cultivated Area**
- This consists of net area sown and current fallows.
- iii) Agriculture Land/ Total Culturable Land**
- Same as cultivable area.

GLOSSARY OF TERMS

GLOSSARY OF TERMS

Active (usable) storage capacity	the total amount of reservoir capacity normally available for release from a reservoir below the maximum storage level. It is total or reservoir capacity minus inactive storage capacity. More specifically, it is the volume of water between the outlet works and the spillway crest.
Alluvium	sediments deposited by erosional processes, usually by streams.
Basin boundary	the topographic dividing line around the perimeter of a basin, beyond which overland flow (i.e., runoff) drains away into another basin.
Bed load	sand, silt, gravel, or soil and rock detritus carried by a stream on or immediately above its bed. The particles of this material have a density or grain size such as to preclude movement far above or for a long distance out of contact with the stream bed under natural conditions of flow.
Bed material	the sediment mixture of which a streambed, lake, pond, reservoir, or estuary bottom is composed.
Biochemical Oxygen Demand (B.O.D.)	the measure of oxygen required for natural oxidation of organic matter with the aid of bacteria. The test is made by taking duplicate samples of water in two completely filled bottles, one of which is sealed and kept stored for 5 days. The dissolved oxygen content of the first sample gives the biochemical oxygen demand, or shortly B.O.D. value. The B.O.D. value of surface waters may be 1 to 10 p.p.m., and for deep well water it would be much less.
Coliform Index	the probable number of coliform organisms present in 100 ml. is known as coliform index. If out of 5 portions be isolated from one sample only, the number of coliforms would be considered to be 1 in 50 ml. or 2 in 100 ml., which would be the coliform index, assuming that the gas formation was due to one coliform only.

dam	any artificial barrier which impounds or diverts water. A dam is generally considered hydrologically significant if it is (i) One and one quarter feet (0.4 meters) or more in height from the natural bed of the stream and has a storage of at least 15 acre-feet, or (ii) has an impounding capacity of 50 acre-feet or more and is at least six feet (2 meters) above the natural bed of the stream.
Discharge	<p>the quantity of water flowing across a section of a channel in a unit time is called the discharge. It is measured in cubic feet or meters per second, briefly called cusecs and cumecs respectively and is equal to the area of section X average velocity. Common units are cubic feet per second (cfs), second-day feet (sdf), and cubic meter per second (cms). Two types of discharges are often measured and recorded:</p> <p>instantaneous discharge: the discharge at a particular instant of time.</p> <p>mean discharge: the arithmetic mean of individual discharges during a period of time.</p> <p>Discharges given are daily observed discharges commencing at 08.00 hrs.</p>
Drainage area	an area around a river rainfall of which flows into the river. Also known as watershed, catchment area, and
Drainage basin	A part of the earth's surface which is occupied by a drainage system which consists of a surface stream with all its tributaries and impounded bodies of water. Also known as watershed, catchment area, and drainage area.
Gross capacity	the maximum volume of water that can be stored in a reservoir.
Ground water	water within the earth that supplies wells and springs; water in the zone of saturation where all openings in rocks and soil are filled, the upper surface of which forms the water table. Also termed Phreatic water.
Ground water runoff	that part of the runoff which has passed into the ground, has become ground water, and has been discharged into a stream channel as spring, or seepage water.

Hardness	hardness of water is generally caused by the presence of salts of calcium and magnesium. Hardness due to the presence of bicarbonates of calcium and magnesium is called temporary hardness. Permanent hardness is caused by the presence of sulphates and chlorides of these metals, and is not removable by boiling. The sum of these two hardness is called total hardness. It is expressed in terms of calcium carbonate. Since one gallon of water weighs 70,000 grains, degrees of hardness can be converted in p.p.m. by multiplying by 14.3. A water having 50 to 100 p.p.m. hardness is called soft water, one with 100 to 200 p.p.m. moderately hard, and that with 200 to 300 p.p.m. hard. Hardness of 80 to 90 p.p.m. is considered to be the best.
Headwater basin	a basin at the headwaters of a river. All discharge of the river at this point is developed within the basin.
Hydrogen-ion Concentration (pH)	<p>acidity and alkalinity determinations measure the amount of acid and alkali present, while the H-ion concentration determines the strength of the acid and alkali in water. An ion is an atom or a group of atoms that carries an electric charge.</p> <p>The H-ion concentration is expressed in terms of logarithm of the reciprocal of the H-ion concentration. This term is called the pH value (potential of Hydrogen). $\log 1/10^{-7} = 7$, so that pH value 7 denotes neutrality while values above 7, signify alkalinity and those below 7, acidity. The determination of pH value provides information concerning the corrosive character of water. Waters with pH between 7.4 and 8.4 are practically inactive.</p> <p>Waters with pH above 8.6 or 8.8 are likely to cause precipitation of calcium carbonate in the distribution system, while waters over-carbonate with CO₂ may dissolve the slight carbonate film on the inside of mains and start active corrosion, depending upon the pH value. When the pH of natural waters is below 7 it may be found necessary to add a small amount of soda ash or lime to the water before admittance to the mains, as otherwise corrosion may be caused.</p>

Hydrologic Cycle	Water is lost to the atmosphere as vapour from the earth, which is then precipitated back in the form of rain, snow, hail, dew, frost, etc. The process of evaporation and precipitation which combines for ever and thereby maintaining a balance between the two is called Hydrologic Cycle.
Hydrologic unit	a geographical area representing part or all of a surface drainage basin or distinct hydrologic feature such as a reservoir, lake, etc.
Hydrology	the applied science concerned with the waters of the earth, their occurrences, distribution, and circulation through the unending hydrologic cycle of: Precipitation, consequent runoff, infiltration, and storage; eventual evaporation; and so forth. It is concerned with the physical and chemical reaction of water with the rest of the earth, and its relation to the life of the earth.
Inactive storage Capacity	the portion of capacity below which the reservoir is not normally drawn, and which is provided for sedimentation, recreation, fish and wildlife, aesthetic reasons, or for the creation of a minimum controlled operational or power head in compliance with operating agreements or restrictions.
Inches of runoff	the volume of water from runoff of a given depth over the entire drainage.
Irrigated area	the gross farm area upon which water is artificially applied for the production of crops, with no reduction for access roads, canals, or farm buildings.
Irrigation efficiency	the percentage of water applied that can be accounted for in soil moisture increase for consumptive use.
Irrigation requirement	the quantity of water, exclusive of precipitation, that is required for crop production. It includes surface evaporation and other economically unavoidable wastes.

Live capacity	the minimum volume of water required for maintaining flow of water from the Reservoir. It is the total amount of storage capacity available in a reservoir for all purposes, from the dead storage level to the normal water or normal pool level surface level. Does not include surcharge, or dead storage, but does include inactive storage, active conservation storage and exclusive flood control storage.
Long term storage dams	reservoirs used for recreational use or storage of irrigation, municipal or industrial water. Because water is impounded on a "permanent" basis, the design of these dams is more complex than for tailings or flood control detention dams. A long term storage dam may include an impermeable core surrounded by shell material, have many types of drains and filters, outlet works, with gates and valves, seepage collection boxes, and possibly several spillways. The capacity of the spillway is dependant upon the downstream hazard potential.
Mean annual rainfall	mean annual rainfall is usually worked out as a simple average of the total rainfall of various years.
Mean depth	the average depth of water in a stream channel or conduit. It is equal to the cross-sectional area divided by the surface width.
Moisture equivalent	the ratio of (1) the weight of water which the soil, after saturation, will retain against a centrifugal force 1,000 times the force of gravity, to (2) the weight of the soil when dry. The ratio is stated as a percentage.
Net rainfall	The portion of rainfall which reaches a stream channel or the concentration point as direct surface flow.
Normal year	the year during which the precipitation or stream flow approximates the average for a long period of record.
Peak discharge	rate of discharge of a volume of water passing a given location. (Usually in cubic feet per second.)
Point discharge	instantaneous rate of discharge, in contrast to the mean rate for an interval of time.
Point precipitation	precipitation at a particular site, in contrast to the mean precipitation over an area.
River Basin	drainage area of a river and its tributaries.
River gauge datum	the arbitrary zero datum elevation which all stage measurements are made from.

Runoff	water which is not absorbed by the soil and flows to lower ground, eventually draining into a stream, river, or other body of water. It is that part of precipitation that flows toward the streams on the surface of the ground or within the ground. Runoff is composed of baseflow and surface runoff.
Runoff/ potential	runoff/ potential of a river for a specified period at a site is the total volume of water flow/passed from/through the site during the specified period. It is the notional depth of water in mm over the catchment, equivalent to annual runoff (in M.Cum.)/Catchment Area (km ²)* 1000 and calculated at the discharge measurement station.
Second-day feet	the volume of water represented by a flow of one cubic foot per second for 24 hours; equal to 84,000 cubic feet. This is used extensively as a unit of runoff volume. Often abbreviated as SDF.
Sediment storage capacity	the volume of a reservoir planned for the deposition of sediment.
Soil moisture	Water contained in the upper regions near the earth's surface.
Stage	the level of the water surface above an established "zero" plane or datum at a given location.
Surface runoff	the runoff that travels overland to the stream channel. Rain that falls on the stream channel is often lumped with this quantity.
Surface water	water that flows in streams and rivers and in natural lakes, in wetlands, and in reservoirs constructed by humans.
Temperature	the in-situ temperature in degree centigrade by thermometer is recorded in terms of water intended use, the treatment to remove impurities and its transport.

Coliform Group	all waters contain bacteria, vast majority of which are perfectly harmless. One organism, bacillus Coli, found in the intestines of men and warm-blooded animals, which in itself is usually quite and may therefore be regarded as danger signal. The group of bacteria of intestinal origin is known as coliform group. The bacilli of this group ferment lactose with gas formation. Since organisms of the coliform group normally live longer in water than other bacteria, absence of such organisms indicates that the water is safe. Also this group is more resistant to treatment than pathogens, their existence or otherwise gives a useful indication of the efficiency of water treatment methods.
Gross reservoir capacity	the total amount of storage capacity available in a reservoir for all purposes from the streambed to the normal water or normal water or normal pool surface level. It does not include surcharge, but does include dead storage.
