Section - 1

WATER AND RELATED RESOURCES

World's oceans cover about three fourth of earth's surface. According to the UN estimates, the total amount of water on earth is about 1400 Million BCM (Billion Cubic Metres), which is enough to cover the earth with a layer of 3000 metres depth. However, the fresh water constitutes a very small proportion of this enormous quantity. About 2.7 % of the total water available on the earth is fresh water of which about 75.2 % lies frozen in polar-regions and another 22.6 % is present as ground water. The rest is available in lakes, rivers, atmosphere, moisture, soil and vegetation. The water is effectively available for consumption and other uses is a small proportion of the quantity available in rivers, lakes and ground water. The crisis about water resources development and management thus arises because most of the water is not available for use and secondly it is characterised by its highly uneven spatial distribution. Accordingly, the importance of water has been recognised and greater emphasis is being laid on its economic use and better management.

(Table 1.1 & Chart 1.1)

Water on the earth is in motion through the hydrological cycle. The utilisation of water for most of the users i.e. human, animal or plant involves movement of water. The dynamic and renewable nature of the water resources and the recurrent need for its utilisation requires that water resources are measured in terms of its flow rates. Thus, water resources have two facets. The dynamic resource, measured, as flow is more relevant for most of developmental needs. The static or fixed nature of the resource, involving the quantity of water, the length or area of the water bodies is also relevant for some activities like pisciculture, navigation

etc. Both these aspects are discussed below.

(i) The Static Resources

Rivers

India is blessed with many rivers. As many as 12 of them are classified as major rivers whose total catchment area is 25.3 lakh Sq. Km. Of the major rivers, the Ganga - Brahmaputra - Meghna system is the largest with catchment area of about 11.0 lakh Sq. Km, which is more than 43 % of the catchment area of all the major rivers in the country. The other major rivers with catchment area more than 1 lakh Sq. Km are Indus (3.21 lakh Sq. Km), Godavari (3.13 lakh Sq. Km), Krishna (2.59 lakh Sq. Km) and Mahanadi (1.42 lakh Sq. Km). The total catchment area of medium rivers is about 2.5 lakh Sq. Km. Of the medium rivers, Subernarekha is the largest with catchment area of about 19.3 thousand Sq. Km. The other rivers with catchment area more than 10 thousand Sq. Km are Palar (including tributary cheyyar), Ponnaiyar, Baitarni and Vamsadhara.

(Tables 1.2 & 1.3)

Water Bodies

Inland Fishery Water resources of the country are classified as rivers and canals; reservoirs; tanks, lakes & ponds; beels, oxbow lakes and derelict water bodies; and brackish water. Other than rivers and canals, total water bodies cover an area of about 7.4 m.ha. Uttar Pradesh occupies the first place with the total length of rivers and canals as 28.5 thousand km., which is about 15 % of the total length of rivers and canals in the country. Other states following Uttar Pradesh are Jammu & Kashmir and Madhya Pradesh. Among the remaining forms of the inland water resources reservoirs have maximum area (2.9 m.ha) followed by tanks, lakes and ponds (2.4 m.ha). Most of the area under tanks, lakes and ponds lies in Southern States of Andhra Pradesh, Karnataka and

Tamil Nadu. These states along with West Bengal, Arunachal Pradesh, Rajasthan, Uttar Pradesh and Orissa, account for 77% of total area under tanks and ponds in the country. As far as reservoirs are concerned, states like Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Tamil Nadu and Uttar Pradesh account for larger portion of area under reservoirs. More than 88 % of area under floodplain lakes and derelict water bodies lies in the states of Arunachal Pradesh, Assam, Kerala, Orissa and Uttar Pradesh. Orissa ranks first as regards the total area of brackish water and is followed by Kerala, West Bengal and Gujarat. The total area of inland water resources (other than rivers and canals) is, thus, unevenly distributed over seven states namely Orissa, Andhra Pradesh, Gujarat, Kerala, West Bengal, Karnataka and Arunachal Pradesh accounting for more than 59% of the country's inland water bodies.

(Table 1.4)

Navigation Waterways

The maximum total length of rivers is in West Bengal (4741 Km.) .The total navigable length is maximum in the state of West Bengal (4593 Km.) followed by Orissa.(1544 Km.)

(Table 1.5)

(ii) The Dynamic Resources

Water Resources of India

The annual precipitation including snowfall, which is the main source of the water in the country, is estimated to be of the order of 4000 BCM. The total volume of rainfall during 1.1.2005 to 31.12.2005 was 3972 BCM as against 3570 BCM recorded during the previous calendar year registering an increase of about 11.3%. For the purpose of seasonal rainfall, country has been divided into 36 meteorological sub-divisions out of which

only 19 have positive departure from normal rainfall during 2005 as against positive departure in only 9 sub-divisions during 2004. There were widespread variations among different sub-divisions in terms of rainfall received. During 1.1.2005 to 31.12.2005 maximum rainfall was recorded in Konkan and Goa (356 Cm.) followed by Coastal Karnataka (328 Cm.), Kerala (315 Cm.), Andaman & Nicobar (276 Cm.) and Sub-Himalayan West Bengal and Sikkim (267 Cm). The rainfall less than 50Cm was recorded only in Rajasthan West. However, total volume of rainfall in the country during 1.1.2003 to 31.12.2003 at 4057 BCM is still higher than that during 1.1.2005 to 31.12.2005

(Tables 1.6(A), 1.6(B), 1.6(C) & Chart 1.2)

The water resources potential of the country which occurs as natural run off in the rivers is about 1869 BCM as per the estimates of Central Water Commission (CWC), considering both surface and ground water as one system. Ganga-Brahmaputra-Meghna system is the major contributor to total water resources potential of the country. Its share is about 59 % in total water resources potential of the various rivers. The estimated per capita availability of water works out to 1678 cubic metre (cu.m.) as on 1st March 2006. Due to various constraints of topography, uneven distribution of resource over space and time, it has been estimated that only about 1123 BCM of total potential of 1869 BCM can be put to beneficial use, 690 BCM being due to surface water resources. Again about 40% of utilisable surface water resources are presently in Ganga – Brahmaputra - Meghna system.

The distribution of water resources potential in the country shows that as against the national per capita annual availability of water of 1820 cu. m. in 2001 the average availability in Brahmaputra and Barak is as high as 14057 cu. m. while it is as low as 308 cu.m. in Sabarmati basin in 2000. Brahmaputra and Barak basin with 7.7% of geographical area and 4.2 % of

population of all the basins in the country has 31 % of the annual water resources. Per capita annual availability for rest of the country excluding Brahmaputra and Barak basin works out to about 1345 cu.m. Any situation of availability of less than 1000 cu. m. per capita is considered by international agencies as scarcity conditions. Cauvery, Pennar, Sabarmati, East Flowing rivers and West Flowing rivers are some of the basins, which fall into this category.

(Table 1.7 & Chart 1.3)

Surface Storage

A total storage capacity of about 213 BCM has been created in the country due to the major & medium projects since completed. The Projects under construction will contribute to additional 76 BCM while the contribution expected from projects under consideration is 107 BCM. Thus likely storage available will be 396 BCM against the total water availability of 1869 BCM in the river basins of the country. Maximum storage again lies in the Ganga Basin, which is far ahead of other basins. The other basins where the live storage capacity of the projects (taking those constructed and under construction) is high are Krishna, Godavari, Narmada and Indus. But if projects under consideration are also taken into account, Brahmaputra & Barak basin will occupy the second place after Ganga Basin. Pennar is the leading basin in terms of storage capacities as percentage of average annual flow. The storage capacities as percentage of average annual flow exceed 50% for Tapi, Krishna, West Flowing Rivers, Narmada, Brahmani and Baitarni basins while for Ganga basin and Brahmaputra - Barak Basin, the corresponding figures are 17 % and 9 % respectively. As the Ganga & Brahmaputra are the leading basins of the country in terms of average annual flow, there is a lot of scope to increase their storage capacities.

(Table 1.8)

Major States like Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Orissa and Uttar Pradesh together account for about 70 % of total live storage capacity in the country. The States of Arunachal Pradesh, Orissa & Uttar Pradesh account for 72 % of the total storage of projects under consideration. (Table 1.9)

Publication also gives latest year's seasonal observed runoff at CWC sites in different river basins of peninsular India namely Godavari, Krishna, East Flowing Rivers, remaining East & West Flowing Rivers, Cauvery, Narmada and Tapi. The statements give station wise details of catchment area upto that station, and average runoff for monsoon and non-monsoon periods for the latest year. Site-wise details of suspended sediment load for different basins namely Godavari, Krishna, Eastern Rivers, Tapi, Mahi, Sabarmati and other West Flowing Rivers, Cauvery and remaining East & West Flowing rivers and Narmada for each of two seasons i.e. monsoon and non-monsoon are also included. As the period of availability of data for different river systems are not uniform, the information has been presented for the latest year for which data are available.

(Tables 1.12 to 1.24)

Ground water

The status of expansion of Hydrograph network in the country can be known from the distribution of ground water hydrograph network stations over the years. Distribution of blocks/ talukas/ water-sheds/ mandals according to over exploited, dark and other categories has also been given. The maximum number in miscellaneous category of 'others' are in the state of Maharashtra (2090) followed by 960 in the state of Andhra Pradesh. In all, out of 7928 blocks in the country, about 86 % of them are in the category of others.

Number of over exploited and dark blocks is about 14% of total blocks in the country.
(Tables 1.25& 1.26)

(Table 1.28)

Total replenishable ground water potential of the country has been estimated as 433 BCM per year. Basinwise breakup of ground water is not available.

Among the States, the highest potential of ground water is in Uttar Pradesh which mostly lies in the Ganga Basin. The potential of Uttar Pradesh is 81 BCM/year. Goa with 0.22 BCM/year is at the bottom most position among the states. Development of Ground Water in Haryana in percentage is the highest followed by Punjab where about 98 % of the resources appear to have been tapped. The other States where the percentage development is more than 50 % are Gujarat(55%), Tamil Nadu (64%) and Rajasthan(86%)

(Tables 1.27)

Irrigation potential

The total ultimate irrigation potential (UIP) of the country stands at about 140 m. ha. The share of Minor Irrigation is higher by 23.07 m.ha. as compared to that of Major & Medium Irrigation. Ground Water contributes more than 79 % of the total ultimate potential through minor irrigation. Uttar Pradesh and Bihar are two largest states in term of potential due to Major & Medium sector. These two states along with Madhya Pradesh, Andhra Pradesh and Maharashtra account for about 54% of the total ultimate potential of Major & Medium Irrigation in the country. The largest UIP for Minor Irrigation (Ground Water) exists in Uttar Pradesh. Andhra Pradesh and Madhya Pradesh are two major states in which potential of Minor Irrigation (Surface Water) is much higher than the remaining states. Uttar Pradesh again occupies the first place among the states so as to have maximum potential due to all type of schemes.

The World's total annual renewable fresh water supply is estimated to be 48.6 thousand BCM. Brazil and former USSR have maximum volume of available fresh water. Bangladesh, Canada, China, Colombia, Republic of Congo, India, Indonesia, Myanmar, USA and Venezuela are other countries whose annual renewable water supply exceeds one thousand BCM. To have a better idea of availability, the per capita series has been worked out for the years 1975, 2000 and 2025. During this period the population of world is likely to grow up from 406 crores to 779 crores. The per capita water availability in world has gone down by 33 % from 1975 level, in 2000. There is a large inter-country variation in the figures of per capita availability in the country. In 1975, Iceland had the highest per capita availability of renewable fresh water which was 770.5 thousand cu. m, followed by Congo, Surinam, Guyana and Papua New Guinea in that order. The availability in Papua New Guinea was less than half of the availability of Iceland. Further idea about the skewness of distribution of water can be had from the fact that Iceland's per capita availability was 64 times the average world availability in the corresponding period.

The relative position of these countries will more or less remain same over the next 50 years, with per capita availability in Iceland in 2025 being 66% of what it was in 1975. The average world availability, however, in 2025 will be only half of 1975. On the other end of scale we have countries like Jordan, Libya, Saudi Arabia, Singapore and Yemen where per capita water availability was less than 1/20th of world average in 1975. In a span of another 25 years i.e. by 2000, the water availability in these countries reduced to 3 % of the world average, which may further reduce to 2.3 % in 2025. India's per capita availability which was about 25.7 % of

average world availability in 1975, had declined to about 23.4 % of world availability in 2000 and is likely to reduce further to about 23 % of world availability in 2025.

(Table 1.29 & Chart 1.8)

Irrigation in World

Analysing the country-wise geographical area, arable land and irrigated area in the World, it is found that among the continents largest geographical area lies in Asia which has about 24% of the world geographic area, about 38 % of world's arable land followed by North Central America having about 19 % of world's arable land. Africa has only 14.2% of world's arable land. Irrigated area in the World is about 19.8% of the arable land in 2003. During the same period, about 70% of world's irrigated area was in Asia. Also 38% of arable land of Asia was irrigated in 2003. United States of America (173.5 m.ha.) has the largest arable land followed by India (160.5 m.ha.).

(Table 1.30 & Chart 1.9)

Dams Scenario

India: As per the National Registrar of Large Dams containing data compiled up to April 2002 on 4525 Dams in the Country, Maharashtra has the maximum number of dams (1651). Decade wise distribution of dams indicates that the maximum number of dams in India were completed during the decades 1971-80 (1263) and 1981-90 (1186).

World : As per the International Water, Power and Dam Construction Year Book 2005 the World's largest dam by volume is in China (Soufengying – $739 \times 10^6 \text{ m}^3$) and the World's highest dam is in Iran (Jafar – Mashnadi (Sahid Yaqobi) – 611 meter)

Table (1.31 to 1.35 & Chart 1.10)

Chart 1 Distribution of World's Water

Sources of Fresh Water

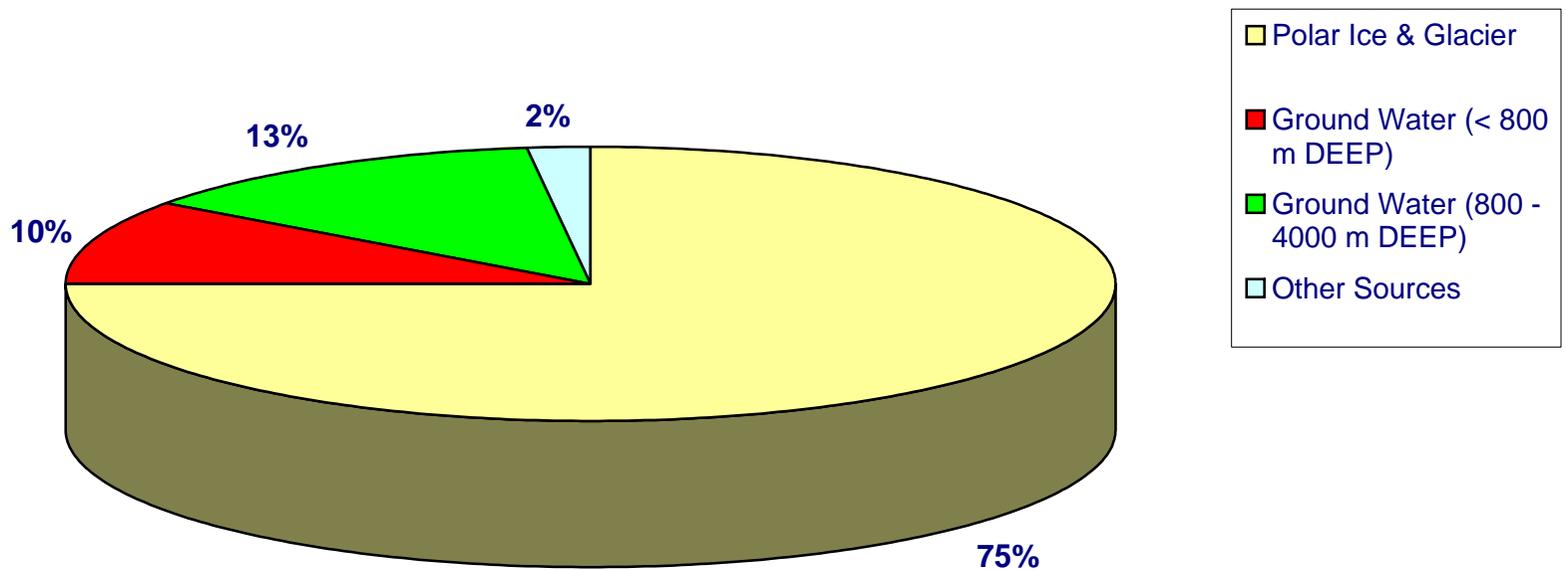

Table : 1.1 Distribution of World's Water

A. Sources of Water (Approximate)

Item	Volume (Million BCM)	% of Total
Salt Water in oceans	1348	97.3
Fresh Water	37.5	2.7

B. Sources of Fresh Water (Approximate)

Of all fresh water, 75.2% is stored in polar ice and glaciers. Another 22.6% is present as groundwater and only a fraction (127,000 BCM) appears at any moment in lakes and rivers.

Item	Volume ('000 BCM)	% of Fresh	% of Total
Polar Ice and Glaciers	28200	75.2	2.04
Ground Water <800 m deep	3740	10.0	0.27
800-4000m deep	4710	12.6	0.34
Lakes & Rivers	127	0.3	0.01
Other (Soil Moisture and Atmospheric Vapour)	704	1.9	0.05

Sources : Ground Water Statistics,2003 (Central Ground Water Board)

* Total Replenishable Gropund Water Resources of the country was estimated to be 433.68 BCM. However, as per decision taken in 1995, the agreed gigureof 432 BCM is retained as rounded off figure of 431.88 BCM .The discrepancy actually has crept in due to inclusion of figures in respect of states Mizoram.Sikkim and U.T of Andaman & Nicobar at a later stage.

Note : 1)Totals may not tally due to rounding off

2) As pet the latest information from CGWB the Annual Replenishable Ground Wate Resources for the country is 433 BCM

Arable Land refers to land under temporary crops (double cropped land is counted only once) temporary meadows for mowing or pasture, land under market & kitchen gardens (including cultivation under grass), & land under temporary fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category.

Section - 2

RESOURCES UTILISATION

This section deals with data on resources utilisation such as cropping pattern, land use, irrigated area, irrigation potential created and utilised, physical achievements under different Command Area Development (CAD) Programmes, electricity consumption in agriculture etc.

Land Use Statistics

The reporting area for the country in 2003-04 was 306 million hectare (m.ha.), which was 93% of the geographical area. Except for Arunachal Pradesh, Goa, Gujarat, Himachal Pradesh, Chandigarh, Jammu & Kashmir, Manipur, Sikkim, Andaman & Nicobar and Daman and Diu the reporting areas for all other States/UTs work out to be more than 99% of their respective geographical area. Rajasthan having reporting area of 34 m.ha. was at the top followed by Maharashtra, Madhya Pradesh, Andhra Pradesh and Uttar Pradesh having reporting area of 31, 31, 27 and 24 m.ha. respectively. The share of these five States in reporting area was 48%.

([Table 2.1](#) & [Chart 11](#))

Total Cultivable Area (TCA) in the country during the year 2003-04 was 183.5 m.ha., which was about 60% of the reporting area. Four States namely Madhya Pradesh, Maharashtra, Rajasthan and Uttar Pradesh accounted for 45.5% of the TCA of the country. The TCA was 3.6% more than the Gross Sown Area (GSA) for the country as a whole for the year 2002-03 while for the year 2003-04 GSA was 3.9% more than TCA for the country as

a whole. But as far as inter-state variations during 2003-04 are concerned, TCA was more than GSA in the State of Andhra Pradesh, Arunachal Pradesh, Gujarat, Jharkhand, Karnataka, Manipur, Meghalaya, Mizoram, Nagaland, Rajasthan, Sikkim, Uttaranchal and Tamil Nadu.

During 2003-04, for the country as a whole, GSA exceeded Net Sown Area (NSA) by about 35%. Punjab (87%), West Bengal (76%) Haryana (81%) Himachal Pradesh (74%) were front runners in this aspect.

The highest cultivable area has been reported for the State of Rajasthan, which is about 26 m.ha. followed by Maharashtra, Uttar Pradesh and Madhya Pradesh having 21, 20 and 17 m.ha. of cultivable area respectively. Rajasthan had the highest cultivable area for the reason that fallow lands and culturable waste lands are more in Rajasthan as compared to other States.

The NSA of the country for the year 2003-04 was 141 m.ha. which was about 46% of the reporting area. Maharashtra had the highest NSA of 17 m.ha. followed by Rajasthan, Uttar Pradesh, Madhya Pradesh with net sown area of 17, 17 and 15 m.ha. respectively. It has been observed that NSA has increased by about 8.2 m.ha., in comparison to 2002-03 figures.

Gross Irrigated Area (GIA) of the country was 40% of the GSA. The highest NIA was in Uttar Pradesh which was 12.4 m.ha. followed by Madhya Pradesh, Rajasthan, Punjab & Andhra Pradesh with NIAs of 5.6, 5.2, 4.0 and 3.6 m.ha. respectively. These five States covered about 56% of NIA of the country. ([Table 2.1](#))

It is estimated that during 2003-04, the GSA per thousand persons was 176.67 hectare at national level. Among the States, Rajasthan ranked first with 361.2 hac. ,followed by Punjab, Madhya Pradesh, Haryana, with 312.4, 309.2 and 284.5 hectares of GSA per thousand persons respectively.

The NSA per thousand persons was 130.15 hectares at national level. It varied from 1.78 hectares in Delhi to 289.98 hectares in Rajasthan. The per thousand persons GIA at All-India level was estimated at 71.19 hectares. Amongst the States, Punjab ranked first at the level of 301.80 hectares per thousand persons. Per thousand persons net irrigated area (NIA) at national level was 51.06 hectares. As in the case of GIA, per thousand persons NIA was again highest in Punjab with 159.39 hectares.

([Table 2.2](#))

Cropping Pattern

The cropping pattern according to land use Statistics shows that the total cropped area in 2003-04 was 191m.ha.. Food-grain cultivation formed 65.5% of the total cropped area, out of which 52.6% attributed to cereals and 12.9% to pulses. Among the cereals, the share of rice and wheat in total cropped area was 22.4 and 13.9% respectively. During 2003-04, the percentage share has slightly gone up for crops namely bajra and maize. The total oilseeds accounted for 13.8% of the total cropped area. The percentage share of the net area sown to total cropped area was 74% during the year.

Analysing the cropping pattern since 1999-00, it is observed that the percentage of cropped area under wheat remained around 13-15% while

the percentage under ragi and barley remained around 0.9 and 0.4 % respectively.

Area sown more than once was 25.5% of the total cropped area in 1999-00, which has gone up to 26% of total cropped area in 2003-04.

([Table 2.3](#) & [Chart 12](#))

Irrigated Area Under Principal Crops

Gross irrigated area during 2003-04, was 76.8 m.ha. of which foodgrain crops contributed about 69% comprising cereals & millets and pulses with 64% and 4.3% respectively. Among the cereals, rice and wheat were the main irrigated crops having their shares in the gross irrigated area at 29.8 and 30.6% respectively. The next in order were sugarcane and rapeseed & mustard with 5.3% and 4.8% respectively.

Among the cereals, it is observed that irrigated area under rice is fluctuating between 21.7 and 24.1 m.ha. during the period 1999-00 to 2003-04. The irrigated area under wheat remained between 22-24 m.ha. during the same period

([Table 2.4](#))

Analysis of data of State-wise irrigated area under different selected crops for the year 2003-04 shows that the major States for rice irrigation are Uttar Pradesh, West Bengal, Andhra Pradesh and Punjab with their share as 18,13,13 and 12% respectively of the total area irrigated under rice. Irrigated area under wheat was concentrated in the States of Uttar Pradesh, Punjab, Madhya Pradesh, Haryana and Bihar with respective share of 37, 14, 13, 10 and 8%. For pulses, Madhya Pradesh had the maximum irrigated area followed by Uttar Pradesh and

Rajasthan. Sugarcane had the highest irrigated area in Uttar Pradesh having its share as 45% in the total irrigated area of this crop in the country.

([Table 2.5](#))

Based on analysis of the time series data of NSA and GSA for foodgrain and all crops for the period 1950-51 to 2003-04, it is observed that NSA has gone up by 18%, GSA (for foodgrain) by 28% and GSA (All crops) by 45%. Area sown more than once has gone up from 13.1 m.ha. to 49.8 m.ha., whereas area irrigated more than once has gone up from 1.7 m.ha. to 21.7 m.ha. during the period 1950-51 to 2003-04.

([Table 2.6](#) & [Chart 13](#))

Sources of Irrigation and Area Irrigated

The main sources of irrigation in the country are canals, tanks and wells including tubewells. Analysing the provisional data on net area irrigated by source for the year 2003-04, it is observed that wells provided 64% irrigation followed by canals with 27.5% and tanks with 3.5% at All-India level. Among the States Mizoram and Meghalaya are the only States getting 100% of its irrigation through canals followed by Jammu & Kashmir, Assam, Chhattisgarh and Orissa with 92, 88, 71 and 68% respectively.

Irrigation by tanks is highest in the State of Tamil Nadu at 18% followed by Jharkhand at 16.5%. Irrigation through wells including tubewells is common in all the States except hilly regions and North-eastern States. The States of Andhra Pradesh, Bihar, Goa, Gujarat, Haryana, Madhya Pradesh, Maharashtra, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh, Uttaranchal and West Bengal got more

than 50% of their total net irrigated area covered by wells during 2003-04. Chandigarh and Lakshdweep got 100% of their net area irrigated through wells.

([Table 2.8](#) & [Chart 14](#))

Irrigation Development in the Country

There are three types of irrigation schemes in the country namely major, medium and minor. The minor schemes are further divided into two categories viz. Surface Water Schemes and Ground Water Schemes.

Analysing the data on potential created and utilised over different Plan periods, it is observed that irrigation potential created has increased from 22.6 m.ha. in pre-plan era to 105.3 m.ha. by the end of IXth Plan(1997-2002) and it is targeted 123.2 m.ha. at the end of Xth Plan. Out of this 46.9 m.ha. is from major & medium schemes and 76.3 m.ha. from minor schemes. The percentage utilisation of total potential created was 79.7 at the end of 2001-02. It remained around 90 to 95% during different Plan periods up to the end of Annual Plans 1990-92. From VIIIth Plan onwards up to 1997-2002, the utilisation percentage continued to be in the range of 80%.

([Tables 2.09 & 2.10](#) and [Charts 15 to 18](#))

Among the States for major & medium projects, the potential created at the end of IXth Plan (1997-2002) is highest for Uttar Pradesh with 7.9 m.ha. followed by Andhra Pradesh, Maharashtra, Bihar, Punjab and Rajasthan with 3.3, 3.2, 2.7, 2.5 and 2.48 m.ha. respectively. The total share of these six States was about 60% in creation of total irrigation potential. The percentage of potential created upto the end of IX Plan to ultimate potential

through Major & Medium Irrigation projects is 63% at national level. The percentage of potential targeted to be created till end of Xth Plan (2007) to ultimate potential is 80% at national level.

Analysing the data on potential utilisation at the end of IXth Plan, it is found that about 84% of the potential created was utilised under major & medium irrigation projects at All-India level. Among the States Tamil Nadu and Tripura were at top with 100% utilisation whereas Punjab, Jammu & Kashmir, Andhra Pradesh, Rajasthan, Orissa, Kerala and West Bengal were having more than 90% utilisation.

[\(Table 2.11\)](#)

For Minor Irrigation, Potential Created and Utilised till the end of IXth Plan 1997-2002 were 68.3 and 52.9 m. ha. respectively at All-India level. The percentage of potential created till 2001-02 to ultimate potential is 83.7 at national level, while it is targeted at 93.5% at the end of Xth Plan.

The percentage of potential utilised for minor irrigation till 2001-02, corresponding to potential created was 77.5% at All-India level. Among the States it is the highest for Haryana with 94.2% potential utilisation followed by Punjab, Goa, Kerala, Rajasthan, Jammu & Kashmir and Himachal Pradesh.

[\(Table 2.14\)](#)

In a nutshell, at the end of IXth Plan (1997-2002), if all the major, medium and minor schemes are considered cumulatively, out of 140 m. ha. of ultimate potential 75.2% has been created of which 79.7% has been utilised at the national level.

[\(Table 2.15 & chart 19\)](#)

The data on irrigation potential created and utilised upto

2003-04 as available in CWC as well as the Gross Irrigated Area from the Ministry of Agriculture are presented. It is observed that if all the Major, Medium and Minor schemes are considered cumulatively, a total of 117 m.ha. of irrigation potential has been created at the All-India level upto 2003-04 out of which 74% has been utilised till 2003-04. The gross irrigated area for 2003-04 is 77 m.ha. Among the states the potential created upto 2003-04 is the highest for Uttar Pradesh at 27.6m.ha. followed by Andhra Pradesh and Maharashtra at 9.4 and 9.1 m.ha respectively. In terms of the GIA for the year 2003-04, Uttaranchal ranks first at 17.93 m.ha. followed by Punjab and Rajasthan at 7.7 and 6.4 m.ha. respectively.

[\(Table 2.16\)](#)

Major & Medium Irrigation Projects

Up to IX Plan (1997-2002), there were 228 completed major projects and another 169 ongoing projects in X Plan (2002-2007). 69 new major projects were taken up in X Plan of which 19 in Andhra Pradesh, 11 in Orissa, 6 each were in Uttar Pradesh and West Bengal and 5 in Haryana. Among the States the largest numbers of major projects completed up to the end of IX Plan were in Uttar Pradesh followed by Tamil Nadu and Maharashtra.

A total of 917 medium projects were completed up to the IX Plan and another 219 are ongoing projects in X Plan period. 136 new medium projects have been included in X Plan. The largest number of 26 new projects were identified in Gujarat. Among the States the largest number of medium projects completed till the end of IX Plan was 187 in Maharashtra followed by Andhra Pradesh, Gujarat, Madhya Pradesh,

and Rajasthan with 114, 114, 101 and 97 projects respectively.

For ongoing medium projects, the maximum number is in Maharashtra (95) followed by Jharkhand (19), Gujarat (18), Karnataka (18) and Orissa(10). Besides major & medium projects there are Extension, Renovation and Modernisation (ERM) Projects also. 87 such projects were completed up to IX Plan and 86 new projects have also been identified in X Plan. Whereas, there are 83 ongoing projects in X Plan. [\(Table 2.17\)](#)

Status of Bore Holes

For minor irrigation, various types of bore holes have been drilled in the country by the Central Ground Water Board. The main types of bore holes are Exploratory Well(EW), Observation Well(OW), Slim Hole(SH), Pizo Metre(PZ) and Deposit Well(DW). The cumulative total of these structures shows that there were 21368 structures as on 31.3.2003 in the country. Out of which DW constitutes about 18% while the remaining 82% are other types of bore holes. Rajasthan, Andhra Pradesh, Karnataka, Gujarat, Uttar Pradesh, Maharashtra and Orissa account for about 57% of the total bore holes in the country. Out of total DW schemes in the country, Rajasthan, Bihar, and Uttar Pradesh each account for about 16%, 14% and 14% respectively. [\(Table2.18\)](#)

Command Area Development

The Command Area Development (CAD) programme was started in 1974-75, as a centrally sponsored scheme to achieve speedy utilisation of irrigation potential created and also to improve productivity in

selected irrigated commands. The important activities of this programme are development of field channels, land levelling, warabandi, and field drains etc. This programme presently covers 312 projects resulting in creation of 23 M.Ha of irrigation potential out of which 16 million ha. has been utilised till the end of September 2005.

[\(Table 2.19\)](#)

The cumulative achievement since inception of the programme till the end of March 2006 shows that there has been created 17.4 m.ha. field channels, 11.10 m.ha warabandi and 1.61m.ha fielddrains.The cumulative achievement of land levelling upto March 2004 is 2.24 m.ha.

[\(Tables 2.20 to 2.23\)](#)

Analysing cumulative data for different CAD programmes for all the states,it is observed that the development up to March 2006, under field channels is the highest for Uttar Pradesh followed by Karnataka Rajasthan Bihar, Maharashtra and Madhya Pradesh. These six States accounted for 74% of the total achievement under the programme.

[\(Table 2.20\)](#)

For land levelling programme, the maximum share in the achievement upto March 2004 was attained by Karnataka followed by Maharashtra, Andhra Pradesh, Gujarat and Rajasthan. These five States together achieved 92% of the total achievement under this programme. [\(Table 2.21\)](#)

In case of warabandi, the maximum cumulative achievement up to March 2006 was reported by Uttar Pradesh, followed by Tamil Nadu, Gujarat, Rajasthan, and Orissa. These

five States accounted for 75% of the total achievement of the programme. Uttar Pradesh(5.2 lakh hec) and Maharashtra (4.3 Lakh hec.) remained the most benefited States under field drains programme up to December 2005. These two States accounted for 61% of the total achievement of the programme.

([Tables 2.22](#) and [2.23](#))

Electricity and its Consumption in Agriculture

Per capita electricity consumption in agriculture has increased from 80.08 KWH in 2002-03 to 81.20 KWH in 2003-04 which is 20.8% of the total consumption of electricity per capita.

Analysing the per capita consumption of electricity in agriculture during 2003-04, it is observed that amongst the States, Gujarat with per capita consumption of 272 kilo watt hour (KWH) was at the top followed by Haryana and Punjab at 249 KWH and 248 KWH respectively. Goa (1067 KWH) is the leading State so far as per capita total electricity consumption is concerned followed by Gujarat(918 KWH) and Punjab (903 KWH). In the U/Ts, Dadra & Nagar Haveli was at 6632 KWH followed by Daman & Diu at 5425 KWH per capita total electricity consumption.

([Tables 2.25](#) & [chart 20](#))

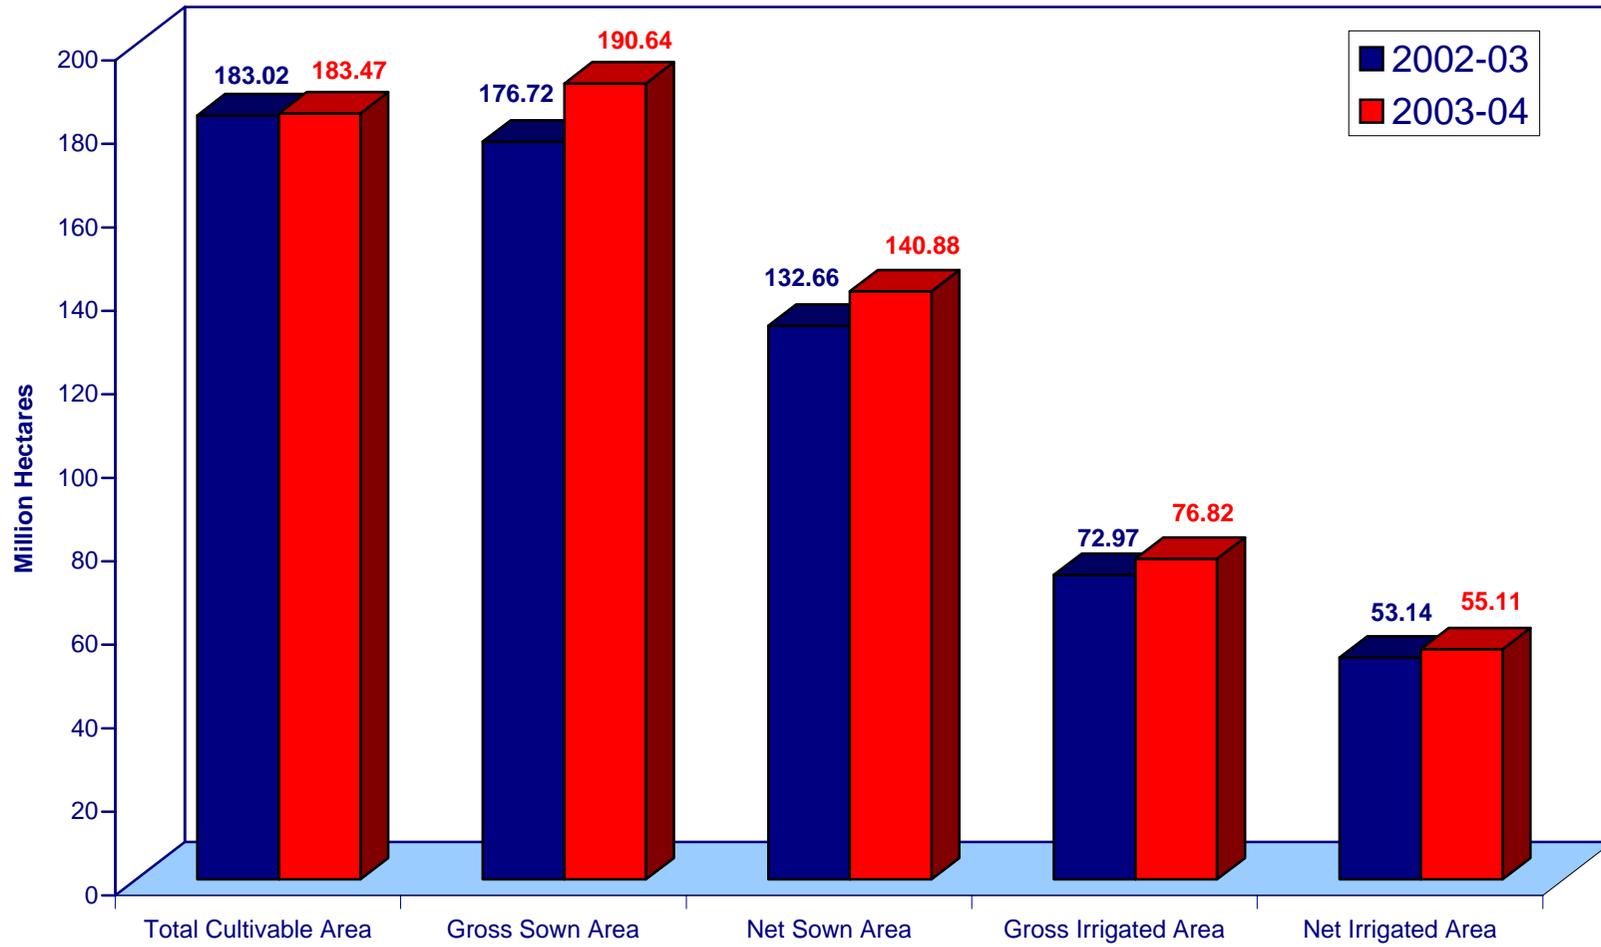

Irrigation pump sets energised as on 31.3.2004, were 14.12 million. Among the regions, southern region was on the top with its share of 42% in total irrigation pumpsets energised followed by western and northern regions with 33% and 21% respectively. Among the States, pumpsets energised were highest in Maharashtra with 2.49 million

pumpsets followed by Andhra Pradesh, Tamil Nadu and Karnataka with 2.31, 1.82 and 1.42 million respectively.

84.3% of villages were electrified till the end of 2004 as per 1991 census. Among the regions, the southern region with 99.6% of villages electrified was followed by western and northern region with 98% and 77% respectively. In 20 states in the country, almost all the villages have been electrified by the end of 2004.

P - Potential Created U - Potential Utilised Totals may not tally due to rounding off.

Note : Irrigation potential created and utilised pertaining to Major & Medium Irrigation Upto VI Plan have been reappraised and are 27695 Thousand ha. and 23574 Thousand ha. respectively and pertaining to minor irrigation upto VIII Plan have also been reappraised and are 95347 Th. Ha. and 75717 Th. Ha respectively.

* : As per Mid Term Appraisal of Tenth Plan, the targets for Major & Medium & Minor Irrigation have been scaled down to 6.5 M.ha. & 4.0 M.ha respectively.

Section - 3

PRODUCTION RELATED PERFORMANCE & ECONOMIC EFFICIENCY

In this Section data on agricultural production in the country and the world for important crops/group of crops, production/ output data for other water related sectors viz; Fisheries, Inland Waterways, Hydro-electric Power, etc. have been presented. In addition, the GDP in the country classified by different economic activities and elaborated further in respect of Agriculture & allied activities is also included. Salient features of important data are briefly described as follows:

Area, Yield, and Production of Crops

As per the final estimates, the area, production and productivity of food grains, rice, wheat, coarse cereals and oilseeds, are estimated to have increased during 2005-06 as compared to those during 2004-05. The area under pulses and cotton during the year 2005-06 has decreased as compared to that in 2004-05. But production for both has registered an increase during the same period thereby resulting in an increase in productivity. In the case of sugarcane productivity is estimated to have increased from 64752 kg/ha to 66928 kg/ha during the same period.

([Table 3.1](#))

From the `break-up of the production of food grains into Kharif and Rabi it is observed that Kharif production have increased by 59.5% from 68.9 m.tones during 1970-71 to

109.9 mtonnes during 2005-06 while the Rabi production has increased by 149% from 39.5 m.tones to 98.7 m.tonnes during the same period. The contribution of Kharif Crops to total food grain production has been showing a general downward trend as is evident by a decline from about 64 % in 1970-71 to 52.7% in 2005-06.

([Table 3.3](#) & [Charts 21](#) & [22](#))

Time-series data of irrigated and unirrigated yield in different States has also been given for selected crops for the period 1998-99 to 2003-04. In case a particular crop is grown in two different seasons, yield rates are given season-wise. The maximum irrigated yield of rice (4158 kg. /ha.) was attained in the State of Tamil Nadu in 1999-2000 and again in 2000-01 at 4104 kg. /ha, followed by an yield of 4102 kg./ha. in Karnataka during 2003-04. Punjab is consistently maintaining a yield rate of over 3000 kg/ha. and having maximum of 3675 kg/ha. in 2003-04. In case of wheat, irrigated yield for Punjab is consistently above 4200 kg/ha, In Haryana, the yield levels for irrigated crop were slightly lower than those in Punjab. In case of Gujarat, Irrigated wheat yield is more than five times the unirrigated yield. In respect of sugarcane, Tamil Nadu has consistently reported highest irrigated yield (over 100 tonnes/ha) over the years. Gujarat has recorded highest irrigated yield of groundnut for the year 2003-04.

([Table 3.4](#))

Inland fish Production

The world today is witnessing resurgence in the consumption of fish, which is a staple food for a vast majority of population. India has the distinction of being the seventh largest

producer of fish in the world and second largest-Producer of Inland fish after China.

The Inland fish production increased quite substantially from 2 lakh tonnes in 1950-51 to 35 lakh tonnes during 2004-05. In 2004-05, the production increased by 0.67 lakh tonnes over that in the previous year. There is a steady increase in Inland fish Production since 1950-51. The Statewise Inland Fish Production during 1990-91 to 2004-05 shows that West Bengal continues to occupy the foremost position among fish producing States, accounting for about 30% of the country's total inland fish production during 2004-05 apparently facilitated by the prevalence of extensive fish pond culture in the State unlike other States which are heavily dependent on rivers/reservoirs for their fish catch. Andhra Pradesh, Uttar Pradesh Bihar, and Orissa are the other major producers of inland fish during the year 2004-05. These States along with West Bengal produced 69% of the total Inland fish production in the country. Productivity of Inland fish per hectare of water bodies during 2003-04 is, however, highest for the State of Punjab at 11.95 tonnes per hectare ([Tables 3.5 to 3.7](#) & [Charts 23 & 24](#))

Inland Water – Transport

Inland Waterways in public sector is managed by government and owned by Central Inland Water Transport Corporation (CIWTC). In addition to this, a major chunk of Inland Waterways Traffic (IWT) is operated & handled by the private sector companies. The Inland Waterways traffic constitutes only a very small part of total transport network in the country which is dominated by rail and road

transport. Apart from suffering due to the problem of spatial dimensions and inadequate drafts in many waterways for bigger vessels to operate, the performance of IWT is likely to be adversely affected by withdrawal of water for other priority consumption such as domestic use, irrigation, industry, etc. Data on cargo/traffic handled and freight earned in respect of some of private companies has been given in the present issue

([Table 3.8](#))

Hydro Power Potential and Generation

The Hydro Electric Power Potential Development in various States and region has been presented in Table 3.9. While 15.22 thousand-mega watt (MW) i.e. about 18.1% of country's total hydroelectric potential (84 .04 thousand MW at 60 % load factor) has been developed as on 1.4.2005, about 5.34 thousand MW (i.e. about 6.35 %) was under development. Contrary to the highest potential assessed in North Eastern Region, the potential actually tapped in this region is not only the lowest but also negligible as compared to other regions. Next highest in order of potential assessed is the Northern Region where again the progress seems to be rather tardy as evident from only 17.08% of the potential has been tapped so far, in addition to another 9.64 % under development. Southern region promises to be the best having tapped nearly 55.04% he assessed potential of 10.76housand MW, which in absolute terms is more than 15%of the potential developed in the Northern Region, notwithstanding the fact that the potential assessed in the northern region is nearly 3 times that in the southern Region. Among the States,

Himachal Pradesh in the Northern region having developed 55.88 % of its assessed potential has the distinction of highest potential developed in absolute terms (2546 MW) in any individual State followed closely by Karnataka (2429 MW) in Southern Region. Uttar Pradesh (83.9 %), Tripura (83.3 %), Haryana (80.7 %), Tamil Nadu (78.3 %) and Punjab (73.7 %) are such States, which have managed to tap a high level of assessed potential though the total relative output in absolute terms is not very substantial. ([Table 3.9](#))

Demand for power is rapidly increasing due to the economic reforms and pace of economic development. In the wake of industrialisation and urbanization, there has been considerable thrust on power development as evident from the expansion in the total installed capacity, which has grown manifold from a meager 1362 MW at the time of independence to 118 thousand MW in 2004-05. The corresponding increase witnessed in the case of Hydropower is from 508 MW to 30942 MW. As regards power generation, a total of 594.46 thousand GWH was generated during 2004-05 out of which the hydropower accounted for about 84.61 thousand GWH i.e. 14.22 % of the total power generation in the country. The share of hydropower development is however declining as seen from its contribution having reduced from 46 % in 1960-61 to 14.22 % in 2004-05. Keeping in view, however, the concern for environmental preservation, need for sustainable development and the importance of using renewable resources, it may be particularly relevant and necessary to promote hydropower development

([Table 3.10](#) and [Charts 25 & 26](#))

Indian Economy and Agriculture

The data on various economic parameters including Agriculture and related sectors based on the National Accounts Statistics with base year 1999-2000 reveal that a steady growth is being maintained. At current prices the combined value of output from agriculture and livestock maintained a rising trend and has reached Rs.679 thousand crores during 2005-06 from Rs.620 thousand crores in 2004-05. From Rs. 409 thousand crores in 1999-2000 (at current prices), the Gross Domestic Product (GDP) from Agriculture and allied activities increased to Rs. 536 thousand crores in 2005-06. Net Domestic Product (NDP) from agriculture and allied activities went up from Rs.390 thousand crores in 1999-2000 to Rs.503 thousand crores in 2005-06. Data at constant prices reflect the growth in a better way. At constant prices the value of inputs is around 21.5 % of the total value of output. Livestock Feed and chemical fertilisers for crops are two of the largest constituents of the inputs accounting for nearly 64 % of the total value of input. Irrigation charges are only a very small component of total input, being less than 1 % of total input value. At constant prices Gross Domestic Product from Agriculture and allied activities shows a growth of 6.31% during 2005-06 over the previous year.

([Tables 3.12 & 3.13](#))

Agriculture is still the most important sector of Indian economy despite having experienced a dilution in terms of its relative contribution in the economy over the years. From about 23% of the total GDP contributed by Agriculture Sector in 1999-2000, its share has reduced to about 18 % in

2005-06 at constant prices. During 2005-06, the GDP for all sectors recorded a growth of 8.9% at constant prices while the corresponding growth of agricultural sector is slower at 6.3 % over the previous year

[\(Table 3.15\)](#)

The Statewise figures are available upto the year 2004-05 only. Analysis of the Net Domestic Product (NDP) at State level and contribution of agriculture to it at current prices shows that agriculture played a particularly dominant role in the economies of Punjab and Haryana, during 1993-94, by way of contributing 48 % & 42 % respectively in the State NDP. The relative share of agriculture in state NDP has been generally declining except in the state of Nagaland. There is a decline in the share of agriculture sector in the economies of almost all major state over time in the wake of rapid pace of industrialisation and higher share of services sector in these States. The State level data on constant prices are available with respect to the old base 1993-94 only.

[\(Tables 3.16 & 3.17\)](#)

International Agriculture Data

The following analysis is based on international data on area, production and yield for total cereals, wheat, paddy, total pulses, sugarcane and maize for the year 2005.

The world average yield of total cereals is 3256 Kg/Ha. Lowest yield rate is in African Continent and highest in North Central America. South America and Asia need special efforts to reach at least European productivity rate for latter's highly increasing population. Among the individual

countries Belgium, Netherlands, New Zealand, UK, Cambodia, France, Ireland, Germany and USA have the yield rates of 8414, 8154, 7665, 7229, 6999,6947, 6855, 6658 and 6454 Kg/Ha against India's 2367 Kg/Ha.

[\(Table 3.22\)](#)

The average world productivity of wheat is about 2898 Kg/Ha, which is more than the corresponding average obtained in African, American and Asian countries. Only European countries contributed much higher average yield compared to the global average. Africa has the lowest average yield of 1805 Kg/Ha against the highest held by Europe having attained an average yield of 3543 Kg/Ha. As far as individual countries are concerned, world's highest yield of wheat was obtained in Netherlands (8720 Kg/Ha), followed by Belgium (8273Kg/Ha) and Ireland (8105 Kg/Ha), whereas the lowest was recorded in Venezuela (333 Kg/Ha). Agro-climatic and soil conditions besides the extent of use of modern agricultural technology are expected to play a major role in determining the yield. India though ranked, fairly well having achieved little less than the world average, could exploit the potential further by way of implementing land ceiling act & land reform measures and streamlining the land-holding sizes to optimum level. As regards Paddy, against the world yield of 4004 Kg/Ha, the corresponding yields in different continents were Oceania (7741 Kg/Ha), North America (6032 Kg/Ha), Europe (5725 Kg/Ha), Asia (4099 Kg/Ha), South America (3966Kg/Ha), and Africa (2033 Kg/Ha). The highest individual yield in any country was obtained in Australia (8600 Kg/Ha). Pulses have much lower average yield compared to wheat and paddy. The global average yield for

pulses (843 Kg/Ha) is about 1/3rd of average yield of wheat and 1/5th of paddy's yield. As far as world scenario is concerned, Europe ranked highest in yield of total pulses (2039 Kg/Ha) while the lowest was in African continent (499 Kg/Ha). The average yield of Asia was also below the average world yield of pulses. The highest and lowest yield in the case of individual countries in the world was in Ireland (5185 Kg/Ha) and Senegal (65 Kg/Ha) respectively. In Asia, Armenia had the distinction to attain the highest yield (2373 Kg/Ha) and followed by Japan (2178 Kg/Ha)

against the continent average of 780 Kg/Ha India's yield was the miserable 612 Kg/Ha much lower than the corresponding Asian average.

([Tables 3.22](#) to [3.24](#))

There is wide variation in yield of Sugarcane & Maize in countries & continents. In general food grain production as explained above have increased over the last 3-4 years and so also the yield rates.

([Tables 3.25](#) & [3.26](#))

Section - 4

FINANCIAL PERFORMANCE

This section deals with the financial aspect of water and related sectors in the country. It presents financial expenditure on irrigation development, financial performance of irrigation sector and other water related activities such as urban and rural water supply schemes, soil and water conservation schemes, area development programmes etc.,

Financial Expenditure on Irrigation

There has been a consistent increase in the annual average financial expenditure on irrigation sector over different Plan periods. But the expenditure has not matched with the growth of total Plan expenditure on all sectors as is evident from the share of expenditure on irrigation to the total which declined from 23% during 1st Plan to about 7% in IXth Plan. It is further expected to decline to 6% during Xth Plan.

([Table 4.1](#) and [chart 29](#))

At constant prices (1993 - 94 = 100), the expenditure on irrigation sector went up about four times from Rs. 6839.9 crores in 1st Plan to Rs. 42680.8 crores in the IXth Plan. It may be noted that the share of major & medium schemes has declined from as high as 85% of the total expenditure in the irrigation sector in the 1st Plan to nearly 78% in the IXth Plan. This is apparently due to progressive emphasis on Minor Irrigation and Command Area Development Programmes in the

subsequent years. Institutional assistance has also contributed quite significantly in the development of minor irrigation in the country as is evident from the increasing institutional support to minor irrigation schemes in terms of total financial expenditure over different Plans. However, the total institutional expenditure also decreased in IX th Plan as compared to that in the VIIIth Plan.

([Table 4.2](#) and [chart 30](#))

Of the total expenditure on major & medium irrigation schemes, a large share of about 93% was concentrated in States of Andhra Pradesh, Bihar, Gujarat, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Tamil Nadu and Uttar Pradesh during IXth Plan while the share of these states in the actual expenditure in 2002-03 is about 90%. Of the total expenditure on minor irrigation under State Expenditure in 2002-03, about 73% was incurred by the States of Andhra Pradesh, Bihar, Gujarat, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Tamil Nadu and Uttar Pradesh. Under institutional minor irrigation schemes a large share (97%) of the total expenditure during 2004-05 was contributed by the states of Andhra Pradesh, Bihar, Gujarat, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Punjab, Rajasthan and Uttar Pradesh.

([Tables 4.3](#) to [4.5](#))

Command Area Development Programme

Command Area Development (CAD) programme primarily aims at the speedy utilisation of irrigation

potential created. It is a centrally sponsored scheme started during 1974-75. Central Government offers assistance to the State Governments for implementation of various activities like land leveling, field channel, warabandi etc.. Beginning with the CAD share of 3.6% in Vth Plan of the combined expenditure on major & medium, minor and CAD programmes it remained 3.5% IX Plan. However, in X Plan approved outlay, the CAD share has been fixed for about 4.7% of the combined expenditure.

From a level of central financial assistance to the tune of 31.3% of the total expenditure on various CAD programmes during VIIIth Plan, the same has increased to a level of 36.7% in the IX Plan. But the total expenditure on CAD has decreased from Rs.1750 crores in VIIIth Plan to Rs. 1518 crores in IXth Plan at constant prices. Andhra Pradesh, Haryana, Kerala, Gujarat, Karnataka, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu and Uttar Pradesh are the major States accounting for about 93 % of releases during IXth Plan under Central assistance to CAD programme.

As regards, expenditure under State sector of CAD programmes Haryana, Maharashtra, Punjab, Rajasthan and Uttar Pradesh Constituted about 64% of the total State sector expenditure during IXth Plan.

([Tables 4.6](#) and [4.7](#) and [chart 31](#))

Financial Performance of Water Resources Development in the Country

Details of Capital Outlay during and at the end of year, Gross Receipts, Working Expenses, interest on the Capital Outlay at the end of the year, Revenue Earned (Gross Receipts – Working Expenses plus Interest) for Irrigation and Multi-purpose river valley projects are also presented in the publication. The extent of recovery of Working Expenses through Gross Receipts reflects an irregular trend primarily because of uneven realisation of revenue receipts over time and remissions/deferment of payment of water rates on account of various natural calamities like flood and drought.

From 19.6% in 1980-81, the percentage of recovery of Working Expenses through Gross Receipts including interest on capital outlay has declined to 4.7% in 2001-02. This virtually means that the Gross Receipt collected failed to meet the Working Expenses.

([Table 4.8](#) and [chart 32](#))

While at current prices, both the annual gross receipts and annual working expenses are showing a rise, the trend in the case of former is relatively subdued compared to latter, which explains the growing gap between the two resulting into mounting losses over the years. The annual working expenses have increased considerably 1980-81 to about Rs.8250 crores in 2001-02. At constant prices (1993-94 =100), the working expenses have increased from Rs.894 crores in 1980-81 to Rs. 5114 crores in 2001-02. The annual Gross Receipts on the other hand increased from about Rs.103 crores in 1980-81 to Rs.652 crores in 2001-02 at current prices and exhibited a

fluctuating trend from Rs. 409 crores in 1980-81 to Rs. 404 crores in 2001-02 at constant prices (1993-94 = 100).

([Tables 4.8 & 4.9](#) and [chart 33](#))

The publication also provides details of year-wise and State-wise Working Expenses and Gross Receipts of irrigation and multi-purpose river valley projects for the years 1997-98 to 2001-02. However, data on break-up of Gross Receipts and Working Expenses into various components are not readily available.

([Table 4.10](#))

The range of water rates prevalent in the States reveal that there is wide inter-state variation for both lift and flow irrigation. This is particularly significant in the States like Gujarat, Andhra Pradesh, Karnataka, Jammu & Kashmir, Maharashtra, Uttar Pradesh and West Bengal.

([Table 4.12](#))

Financial performance of Minor Irrigation may be analysed from the data on Financial Aspects of Minor Irrigation Schemes, Soil and Water Conservation Schemes and Area Development Programmes presented in the publication. Although, break-up of Gross Receipts from these schemes is not available but the Working Expenses have been given separately which tend to restrict a more meaningful analysis.

The Working Expenses for Minor Irrigation at Rs. 2098 crores is higher compared to Soil & Water Conservation schemes (Rs.1,072 crores) and Area Development Programmes(Rs.271.6 crores) during

2001-02. Within minor irrigation schemes the expenses are more or less equally incurred by tubewells, investigation of ground water resources and lift irrigation schemes followed by construction and deepening of wells and tanks. Expenses on soil conservation schemes is the highest under soil and water conservation Programmes. Similarly expenses on Ayacut Development is the highest under Area Development Programme

([Tables 4.13](#) and [4.15](#))

The main States where tubewells account for major portion of total expenses on minor irrigation schemes are Bihar, Gujarat and Punjab. The expenses on deepening of Wells and Tanks are taking away major portion of total expenses in the States like Andhra Pradesh, Karnataka and Tamil Nadu. Lift irrigation and other minor irrigation schemes contribute towards major share of total expenses in the States of Assam, Himachal Pradesh, Orissa and West Bengal.

([Table 4.16](#))

As regards the receipts from Minor Irrigation Schemes, Tubewell once again is the major source followed by lift irrigation schemes and Deepening of wells/tanks during 2001-02

([Table 4.19](#))

Financial performance of rural and urban water supply schemes.

The financial performance of Rural and Urban water supply

schemes is fairly similar to the other different categories of schemes in irrigation sector. The capital outlay for Rural Water Supply Schemes has increased from about Rs.93 crores in 1980-81 to Rs. 1,804 crores in 2001-02. While the realisation of Gross Receipts has shown improvement during this period, the over-riding impact of simultaneous increase in Working Expenses leads to steep losses. From a level of Rs.166 crores, the losses have increased to Rs.2,694 crores in the corresponding period.

[\(Table 4.23\)](#)

During 2001-02 about 63% of the total capital outlay for Rural Water Supply Schemes in the country was earmarked for Andhra Pradesh, Rajasthan Tamil Nadu and Gujarat. The other States where the capital outlay during the year remained comparatively higher are Haryana, Himachal Pradesh and Jammu & Kashmir. In the year 2001-02 Rajasthan and Goa have the credit of realising the maximum receipts among all the States, which were Rs. 23.4 crores and Rs.12.05 crores respectively followed by Punjab at Rs.11.22 crores.

In so far as the Working Expenses are concerned in 2001-02, the States like Maharashtra, Madhya Pradesh, Andhra Pradesh, Uttar Pradesh, Uttaranchal, Rajasthan, Himachal Pradesh and West Bengal have fairly high expenditure whereas the recovery of Working Expenses by way of gross receipts is very inadequate not only for these States but nearly in all other States except Goa.

The Receipts in Punjab and Rajasthan covered about 12% and 10% respectively of their respective Working Expenses on rural water supply schemes

[\(Table 4.25\)](#)

The position of different financial parameters of Urban Water Supply Schemes is, however, greatly at variance from those of Rural Water Supply Schemes. This may be due to several factors including (i) system of realisation of receipts in the urban areas (ii) size of schemes and (iii) subsidies etc,. Nevertheless, the losses seemed unavoidable though the intensity of such losses was less severe in comparison to corresponding losses being incurred by Rural Water Supply Schemes. From a level of Rs. 458 crores in 1995-96, the losses from Urban Water Supply Schemes in the country increased to Rs. 954 crores in 2001-02.

[\(Tables 4.24 and 4.26\)](#)

The states where the percentage recovery of working expenses during 2001-02 is relatively higher are Goa(40%) ,Haryana(20%), Manipur(40%), Nagaland(26%), Orissa(26%) and Pondicherry(47%). However, the recovery rate of working expenses at all-India level was 0.97% only.

@ Combined receipt for Urban and Rural water supply.

@@ Schemes amounting to Rs.103.36 crores have been transferred from urban supply rural supply in respect of the state of Meghalaya.

Includes Rural Water Supply also.

\$ An amount of Rs. 21.02 crores not specified in the Fin. Account Books of Rajasthan state has been included

* An amount of Rs. 103.36 crores has been transferred from urban water supply to rural water supply during 1999-2000 in respect of Meghalaya state.

Section – 5

SOCIAL AND ENVIRONMENTAL PERFORMANCE

This section presents information regarding social and environmental aspects of water resources development activities. It includes data on degraded land and their distribution according to various problems, financial and physical achievements of irrigation development in tribal areas, flood damages, financial expenditure on flood protection works and physical benefit there from, performance of flood forecasting net work, financial and physical progress of drinking water supply schemes in rural and urban areas, ground water potential of Tribal and Drought Prone districts and districts covered under Desert Development Programme and its exploitation, water quality parameters of peninsular rivers at Central Water Commission(CWC) sites. Important information given under this section is highlighted below.

Land Resources and its Degradation

As per the data available from the Ministry of Agriculture, a total of 146.82 M.Ha. of land was estimated to be degraded in the country. Out of this, Madhya Pradesh and Chattisgarh together accounted for 26.21 M.Ha. while Uttar Pradesh and Uttaranchal together accounted for 15.32 M.Ha of degraded land. The extent of degraded land in Andhra Pradesh, Maharashtra, Rajasthan and Gujarat was 14.99 M.Ha. ,13.06 M.Ha., 11.37 M.Ha. and

8.13 M.Ha respectively. These seven States together accounted for 61% of the total degraded land in the country. Cause-wise, water erosion accounted for the major part (63.7%) of the total degraded land in the country, followed by soil acidity (10.9%) and water logging (9.7%). Thus, at all-India level the Water Erosion is the predominant cause for land degradation in the country. At State level also, except for Haryana, Kerala and Rajasthan, water erosion is the predominant cause for land degradation. Wind erosion is the main cause behind land degradation in Haryana whereas water logging and wind erosion respectively are the predominant factors in Kerala and Rajasthan.

([Table 5.1](#))

Land degradation affects availability of land for agricultural use and fertility of soil and has ultimate bearing on productivity and consequently on production. Land affected by special problems, erosion and other problems, therefore, needs immediate treatment in the light of rapid population growth and increasing demand for food grain production which is important for food security. In view of importance and gravity of the problem, the Ministries of Agriculture, Rural Development and Environment & Forests have taken up a number of programmes for treatment of degraded lands through various Watershed Development Programmes. A total of 150.67 lakh ha. of land is reported to have been treated up to March 2005 in the country involving an expenditure of Rs.6182.98 crores through the schemes under M/o Agriculture while 118.81 lakh ha. of area in the country is

reported to have been treated up to March 2000 with an investment of Rs 3912.14 Crore through the schemes under Ministries of Rural Development and Environment & Forests.

[\(Table 5.2\)](#)

Drought Prone Area Programme

As per the data available from the Ministry of Rural Development the list of districts covered under Drought Prone Area Programme along with the no of blocks and their area is presented statewise. It is observed that the maximum drought prone area falls under the state of Maharashtra followed by Andhra Pradesh and Madhya Pradesh.

[\(Table 5.3\)](#)

Irrigation Development Under Tribal Sub-Plan

The Tribal Sub-Plan (TSP) came into operation during V Plan. As per the latest available data, a total of 684 (161 major, 481 medium and 42 ERM) irrigation projects are lying under TSP. These projects are confined to the States of Andhra Pradesh, Assam, Jharkhand, Gujarat, Kerala, Karnataka, Madhya Pradesh, Maharashtra, Manipur, Orissa, Rajasthan, Tamil Nadu, West Bengal and Chattisgarh. The total ultimate potential from these projects is 17.5 M.ha., out of which 1.8 M.ha. is in Tribal areas. A total of 155 irrigation projects benefiting TSP area were completed before the start of Tribal Sub-Plan. The ultimate irrigation potential of these projects was about 2392 Thousand Hectares(Th.ha.) of which only 29 Th.ha. was under the Tribal areas. A total of 49 projects were completed during IXth Plan. The ultimate potential from these projects is 1594 Th. ha. of which about 290 Th.ha.

was under the Tribal areas. There are 230 ongoing projects under TSP having ultimate irrigation potential of 10.16 M.. ha. out of which 1.19 M.ha. is under Tribal area. During Xth Plan there were 51 new projects with an outlay of Rs. 1367 crore for 2002-07. These new projects having Ultimate Irrigation Potential of 981 Th Ha. are spread over 8 states namely Andhra Pradesh, Assam, Chattisgarh, Jharkhand, Gujarat, Madhya Pradesh, Orissa and West Bengal.

Among the States, Maharashtra has the maximum number of on-going projects (68) under Major, Medium and ERM irrigation projects benefiting TSP followed by Gujarat (27) and Jharkhand (22). The ultimate potential is highest for the State of Gujarat followed by Maharashtra and Andhra Pradesh. It is lowest in case of Manipur. Amongst the available figures, the Irrigation potential in TSP area is highest in Orissa. The estimated cost of on-going projects is maximum for the State of Gujarat followed by Maharashtra and Madhya Pradesh.

[\(Tables 5.4 to 5.10\)](#)

Flood

Flood is one of the most devastating natural calamities, which has been causing extensive damage to life and property besides perpetrating tremendous sufferings. Since flood is a natural phenomenon, it is usually difficult to predict a definite trend especially with regard to the time and place of its occurrence. As such, the effort usually is to take appropriate advance flood protection measures. The area affected by floods was 2.29 m.ha. in 1953 and 8.03 m.ha. in 2004 with a peak of 17.5 m.ha. during 1978. At current prices, the damage to crops was in the wide range of Rs. 5.87 crore

in 1965 and Rs. 4246.2 crore in 2000. The floods also caused extensive damage to property worth Rs 615 crore in 2004. In addition, there was a great loss of human lives and livestock often affecting the poor strata of the population. Taking into consideration the other factors such as serious disruption and massive health rehabilitation measures needed, the loss could indeed be tremendous. The total damage caused by floods is estimated to the tune of Rs.3337 crore during 2004. Himachal Pradesh and West Bengal are worst effected in terms of the total damage to crops, houses and public utilities. As per the information are for the States for 2005 (upto 31.10.05), there has been a considerable increase in the governmental expenditure on flood management programme over the past years. It has gone up from Rs.13 crore during 1st Plan to Rs.3081 crore during IX Plan and the approved outlay for tenth plan is Rs. 5922 crore. The central assistance in flood control work has risen sharply from Rs. 462.5 crore in the IX plan to Rs. 1308 crore (outlay) in the X Plan.

Among the states the maximum outlay for flood management during X Plan is for Bihar followed by West Bengal and Punjab. As for as the area benefited upto 2004 due to flood management programme is concerned Punjab ranks first followed by Bihar and West Bengal.

([Table 5.11](#) to [5.17](#) and [Chart 34](#))

Flood forecasting is one of the most important non-structural methods of flood control in which there has been significant contribution by CWC. Network performance for the period 01/05/2004 to 31/10/2004 (4696 accurate forecasts out of 4889 issued)

has been quite satisfactory. 96.1 % of forecasts were correct within +/-15 cms or +/- 20% cumecs. Over the years, the percentage of forecasts accuracy has been maintained at around 96% and above apparently due to improvement in methodology and acquisition of latest technology.

([Tables 5.18](#) to [5.20](#))

Drinking Water

The requirement of fresh water both for irrigation and other uses is growing continuously. From a requirement level of 541 BCM in 2000, the water requirement for irrigation is projected to be of the order of 910 BCM in 2025 and 1072 BCM in 2050. The demand for other uses (such as domestic, Industries, thermal power consumption etc.) is likely to grow from 93 BCM in 2000 to 183 BCM in 2025 and 375 BCM in 2050. Modern pace of development, population growth, industrialisation and urbanisation are responsible for higher level of water consumption now. Among various uses of fresh water, the requirement for the industries is expected to grow fastest by about 8 times to touch the level of 63 BCM in 2050 from the level of 8 BCM in 2000. The total water demand for all the uses is likely to be 1447 BCM by 2050. Though major share of this would be consumed for irrigation purposes, this in no way undermines importance of providing potable drinking water. In fact, it may be presumed that drinking water provision would have to be given an added thrust since the lack of such facility is likely to entail serious social, economic and health impact.

([Tables 5.21](#) to [5.22](#))

There are different schemes and programmes being implemented

with the objective to provide access to safe drinking water in rural areas. In terms of population, according to the data on progress achieved during 2005-06, maximum population covered was in Tamil Nadu (26.1 lakh), followed by Andhra Pradesh (16.6 lakh) and Chattisgarh (11.6 lakh) against total coverage of 125.6 lakh in the whole country. Highest coverage of Scheduled Castes population has been attained in the State of Andhra Pradesh (4.1 lakh) whereas coverage for Scheduled Tribe population is highest in Chattisgarh (4.1 lakh).

([Table 5.23](#) to [5.24](#))

Expenditure under Rural Water Supply Programme for supply of drinking water to rural areas during IX Plan was Rs.10773 crore out of which the major expenditure was by Maharashtra (Rs.2128 crore). The next highest was Tamil Nadu where the expenditure incurred was to the tune of Rs.1229 crore. Maharashtra along with Tamil Nadu accounted for about one third of total expenditure incurred by the country under this programme. The corresponding data is also available for the first four years of Xth Plan. During 2005-06 Tamil Nadu incurred the maximum expenditure under the programme followed by Uttar Pradesh and Rajasthan. As regards expenditure under Accelerated Rural Water Supply Programme, Maharashtra incurred maximum expenditure during IX Plan followed by Rajasthan and Uttar Pradesh.

([Table 5.25](#) & [5.26](#))

Under Urban Water Supply Programme, 92 % of the urban population of the country was covered upto March, 2004. However, entire urban population of Delhi, Himachal Pradesh, Madhya Pradesh, Rajasthan, Uttaranchal and UT of Chandigarh

have been covered under this programme whereas Gujarat, Jammu & Kashmir, Maharashtra, Meghalaya, Tamil Nadu, Tripura, Uttar Pradesh, and UTs of Andaman & Nicobar and Pondicherry have more than 90 % of their urban population covered under this scheme till March 2004.

([Table 5.27](#))

Ground Water Potential and its Exploitation in Special Areas

i) Tribal Areas

Maximum number of Tribal districts are in the State of Madhya Pradesh and Ground Water potential of Tribal districts is also the highest in the State. West Bengal comes second in terms of the number of tribal districts and ground water potential in so far as tribal areas are concerned. However, while the highest percentage of groundwater development had been attained in Tamil Nadu (70 %) followed by Uttar Pradesh (40 %) and Rajasthan (39 %). The development of groundwater potential is minimum in tribal districts of Bihar. The other States where the utilisation of potential is low include Assam, Tripura and Orissa.

([Table 5.28](#))

ii) Drought Prone Areas

Number of drought prone districts is maximum in Uttar Pradesh, followed by Maharashtra. Ground water potential in these two States also is substantially high as compared to the corresponding potential in drought prone districts of other States. Ground water development in drought prone areas of various States is comparatively better vis-a-vis tribal area. Haryana has over exploited its

resources to the extent of 167 %. In many States the groundwater development in drought prone areas is around 30 % with the minimum in Orissa (6 %).

[\(Table 5.29\)](#)

iii) Desert Areas

Gujarat, Haryana, Rajasthan, Jammu & Kashmir and Himachal Pradesh are the States covered by Desert Development Programme. Highest number of districts covered under this programme are obviously in Rajasthan which incidentally is having the highest level of ground water potential closely followed by Haryana though the latter is having only 4 districts as, compared to 11 in Rajasthan. Rajasthan and Haryana exploited around 54 % and 35 % respectively of potential whereas Gujarat managed to develop around 86 %.

[\(Table 5.30\)](#)

Water Quality Parameters

The publication gives range of Variation of various water quality parameters at CWC sites for the river basins of Godavari, Cauvery, Narmada, Krishna, Mahanadi, East Flowing Rivers and West Flowing Rivers. The parameters covered include pH value, specific conductance, sodium absorption ratio, total dissolved solid and maximum values of chloride, sulphate, nitrate, iron, magnesium, sodium percentage, residual sodium carbonate and total hardness.

Table-5.19 Broad Features of the Flood Forecasting Performance of FF&W Network of CWC During the Flood Season 2004 (i.e. Between 01.05.2004 and 31.10.2004)

S.No.	Details of Flood Forecasting Performance during the Flood Season 2004	No. of F.F. sites	%age of F.F. sites
1	2	3	4
1	No of operational Flood Forecasting stations During the Flood Season	172	100
2	Flood Forecasting Sites where " No Forecast" was issued / required because water levels at those sites were below warning stages during the flood season	60	34.9%
3	Flood Forecasting Sites where " Forecasts were Actually " issued during the flood	112	65.1%
4	Flood Forecasting sites where Forecasting accuracy was "100%" (out of 172 Sites)	49	28.3
5	No of Flood Forecasting sites where Forecasting accuracy was Nil (i.e. where all issued forecasts were out of prescribed limits of accuracy (+/- 15cm, +/- 20% cumecs)	Nil	Not Applicable
6	Total number of flood forecasts issued during the Flood Season	4889	
7	Total number of correct forecasts issued during the flood season within prescribed limit of accuracy of +/- 15cm or +/- 20%cumecs	4696 (96.1%)	
8	Total number of flood forecasting sites where the accuracy of forecasts issued were equal or more than the %age of the accuracy of item no.7cited above	70 (62.5%)	
9	Average number of flood forecasts issued per site (I.e. sites where forecasted sites are acually issued during the flood season	44

Source : Hydrology Data Directorate (ISO), Central Water Commission.

Remarks : pH : The logarithm to the base 10 of the reciprocal of Hydrogen ion concentration

Cl : Chlorine , SO4 : Sulphate , NO3 : Nitrate , Fe : Iron , Mg : Magnesium ,

SP :Sodium Percentage,RSC :Residual Sodium Carbonate,me/l: milli equivalent per litre.

**Table 5.38 Minimum & Maximum of Observed Value of Water Quality Parameters
at CWC Sites on Mahanadi Basin (June 2002 to May 2003)**
